## Acknowledgements

Firstly, we would like to thank the thousands of volunteers that give their time and expertise to counting waterbirds. Without their active support and participation in the census, collecting and submitting the count data over these last years, it would not have been possible to collate this wealth of information and produce this report. The list of participants is held by the coordinators. In addition, we acknowledge counts provided by Igor Fefelov in Russia, Glenn McKinlay in Palau and the China Coastal Waterbird Census team in coordination with Vivian Fu.

An important element of the Asian Waterbird Census is that it works in partnership with many existing national waterbird census programmes. The synthesis of the count data at the flyway and regional level provides added value back to the national count programmes as it gives the larger geographic overview of the status of populations and species. We thank and greatly appreciate efforts of all country and sub-country AWC Coordinators (**current** and past) for all their hard work and effort in coordinating and promoting the counts, including:

**Dan Weller** and Golo Mauer (BirdLife Australia), **Enam Ul Haque** (Bangladesh Bird Club), **Sherub Sherub** (Ugyen Wangchuck Institute for Conservation & Environment, Bhutan), **Shirley Hee** (Panaga Natural History Society, Brunei Darussalam), **Hong Chamnan** (Wildlife Conservation Society, Cambodia), **Lu Yong** (Wetlands International – China), **Yu Yat Tung** (Hong Kong Bird Watching Society), **Woei-horng Fang** (Chinese Wild Bird Federation, Taiwan), **Da-Li Lin** (Taiwan New Year Bird Count), **Raju Kasambe** and Asad Rahmani (Bombay Natural History Society, India), **Yus Rusila Noor** (Wetlands International Indonesia Programme), **Kaori Tsujita** and Makiko Yanagiya, Naoki AMAKO (Ministry of the Environment, Japan), **Jin Han Kim** and Hwa-Jung Kim (National Institute of Biological Resources, Republic of Korea), Yeap Chin Aik (Malaysian Nature Society), **Gombobaatar Sundev** (Mongolian Ornithological Society), **Thet Zaw Naing** & Thein Aung (Myanmar Bird and Nature Society), **Hem Sagar Baral** (Himalayan Nature, Nepal), **David Melville** (Ornithological Society of New Zealand), **Umeed Khalid** (Ministry of Climate Change, Pakistan), **Anson Tagtag** and Carlo Custodio (DENR, the Philippines), **Lim Kim Keang** (Nature Society, Singapore), **Udaya Sirivardana** and Deepal Warakagoda (Ceylon Bird Club, Sri Lanka), **Krairat Eiamampai** and Budsabong Kanchanasaka (National Parks, Wildlife and Plant Conservation Department, Thailand), **Thattaya Bidayabha**, Philip Round, Ingkayut Saar and Wicha Narungsri (Bird Conservation Society of Thailand), and **Le Trong Trai** (Viet Nature Conservation Centre).

In India, we are grateful to the following network of sub-national/state coordinators (**current** and past): **Humayun Taher** and M. Shafaat Ulla, Birdwatcher Society of Andhra Pradesh; **Prasanta Saikia** and P. C. Bhattacharya, Gauhati University, Assam; **Arvind Mishra**, Mandar Nature Club, Bihar; **A.K. Bharos**, Chhattisgarh Wildlife Society; **Tarun K. Roy**, Delhi; **B. M. Parasharya**, Bird Conservation Society, Gujarat; **Pronoy Baidya** and Heinz Lainer, Goa Bird Conservation Network; Suresh C. Sharma, Haryana; **Pankaj Chandan**, World Wide Fund for Nature – India, Jammu & Kashmir; **Satya Prakash**, Neo Human Foundation, Jharkhand; **S. Subramanya**, Karnataka; **P. O. Nameer**, Kerala Agricultural University; **Anil B. Pimplapure**, Vidharba Nature and Human Society, Maharashtra; **Monalisa Bhujabal** and U.N. Dev, Odisha; Rakesh Vyas, Rajasthan; **Neeraj Srivastava**, Uttar Pradesh; **Kumaran Sathasivam** and **KV Sudhakar**, Madras Naturalist Society, and Lalitha Vijayan, Tamil Nadu; and **Kushal Mookherjee**, Prakriti Samsad, West Bengal and **Anwaruddin Chowdhury**.

The Japan data was kindly provided by Toshifumi Moriya of the Japan Bird Research Association on behalf of the Ministry of the Environment of Japan. Adrian Reigen has managed the database in New Zealand. We greatly appreciate useful feedback to the report from coordinators and experts including Richard Hearn, Chair of the EAAFP Baer's Pochard Task Force.

We also appreciate the efforts of our colleagues in our South Asia office, Akoijam Yaiphaba Meetei, Kamal Dalakoti and Bharat Jethva who have led on collation of the India data under the supervision of Ritesh Kumar, database assistance by Ragil Satriyo Gumilang in our Indonesia office, guidance of Chen Kelin in our China office and support from Arne Jensen in the Philippines and Ward Hagemeyer in our Head Office.

Finally, we thank the Ministry of the Environment of Japan and the Board of Association of Wetlands International for providing the generous financial resources for regional coordination of the AWC over the last years and to enable us to compile this report.

## Introduction

The Asian region is home to a high diversity of waterbirds, including an increasing number of threatened species, many at risk of extinction (Wetlands International 2012). Conservation of these species and their habitats needs to be based on quality and current information on their distribution and trends. To address this need, the Asian Waterbird Census (AWC) has been collating and disseminating information since 1987 to inform governments, conventions and the public. The AWC runs in parallel with other waterbird censuses carried out in Africa, Europe, Central and West Asia, the Caribbean, Central and South America under the umbrella of the International Waterbird Census (IWC). The IWC is coordinated internationally by Wetlands International (with the exception of the Caribbean and Central America). The IWC is considered one of the largest and longest-running internationally coordinated citizen science biodiversity monitoring programmes in the world.

The AWC currently covers 25 countries and regions of Asia and Australasia and takes place annually during the second and third weeks of January with additional counts being provided from some countries between late November to February. The census is carried out by volunteers, and in some cases government staff, interested in collecting information on waterbirds and wetlands as a basis for contributing to their conservation.

The data collected by the AWC contributes to a range of local, national and flyway-scale conservation activities including:

- species and site conservation and research programmes and campaigns to raise awareness of the importance of wetlands in many countries;
- the development of national wetland and waterbird conservation Action Plans and Strategies (NBSAPs);
- the Ramsar Convention on Wetlands, by identifying and monitoring Wetlands of International Importance and other wetlands;
- the Convention on Migratory Species (CMS), by monitoring the status of migratory waterbirds and their habitats;
- the Convention on Biological Diversity's goal of conservation and sustainable use of biodiversity;
- the East Asian – Australasian Flyway Partnership (EAAFP) and its Flyway Site Network and other important sites;
- the CMS's West/Central Asian Site Network for the Siberian Crane and other waterbirds;
- BirdLife International's Important Bird and Biodiversity Area (IBA) programme; and Key Biodiversity Areas (KBAs);
- IUCN/BirdLife International's globally threatened birds programme;
- Wetlands International's Waterbird Population Estimates (WPE) programme; and
- the studies of wild bird movements and relationships to avian disease (especially highly pathogenic avian influenza) transmission that affect wild birds, poultry and humans and in planning response measures.

In addition to the wide range of applications outlined above, the IWC has been extremely successful in achieving its primary objectives of:

- providing the basis for estimates of waterbird populations (e.g. Bamford et al, 2006; Hansen et al, in prep.)
- monitoring changes in waterbird numbers and distribution by regular, standardised counts of representative wetlands;
- improving knowledge of little-known waterbird species and wetland sites;
- increasing awareness of the importance of waterbirds and their wetland habitats at local, national and international levels.

The EAAFP in its Implementation Strategy 2012 – 2016 Outcome 6 call for "*Scientifically sound information is available on the flyway-wide status and trends of waterbird populations and their habitats*". It recognises that the AWC, an ongoing regional waterbird monitoring programme "*can continue to provide good information, the extent of their coverage is in need of enhancement and related capacity building can improve the quality of the information*".

As a result of their increased awareness, local people and governments are now working to conserve important sites in most of the countries covered by the census. However, coverage and conservation efforts vary considerably, and the increasing pressure on wetlands and their biodiversity highlights the need to strengthen the programme to address ever-growing challenges. These include global climate change and its far-reaching impacts on changes in distribution and types of wetlands, as well as seasonal variations linked to probable changes in the carrying capacities of the wetlands used by the waterbirds for feeding, nesting and roosting.

The AWC has also built and strengthened national networks of enthusiastic and dedicated volunteers and facilitated their training as an integral part of achieving its objectives.

The information shared with Wetlands International has been collated into a variety of regional summaries and overviews (van der Ven 1987, 1988; Scott and Rose 1989; Perennou *et al.* 1990; Perennou and Mundkur 1991, 1992; Mundkur and Taylor 1993, Perennou *et al.* 1994, Lopez and Mundkur 1997, Li and Mundkur 2004 and Lopez and Mundkur 2007). The most comprehensive report covers the AWC between 1987- 2007 (Li *et al.* 2009). Readers are advised to refer to this publication for additional detailed information on the value and rationale for monitoring waterbirds, organisation of the IWC, methods, data collection and management, counting and reporting methods, interpretation of waterbird counts and related information.

Several of the countries and regions covered by this report regularly produce their own national reports or summaries and provide a wealth of knowledge on local and national situations of waterbirds and their conservation issues.

This report collates information shared with Wetlands International to cover the northern hemisphere winter seasons between 2008 and 2015.

## Methods

The geographic coverage of the AWC includes the following four main regions: South Asia (Bangladesh, Bhutan, India, the Maldives, Nepal, Pakistan and Sri Lanka), Southeast Asia (Brunei Darussalam, Cambodia, Timor-Leste, Indonesia, Lao PDR, Malaysia, Myanmar, the Philippines, Singapore, Thailand and Viet Nam), East Asia (mainland China, Hong Kong Special Administrative Region (SAR), Taiwan, Macau, Japan, Democratic People's Republic of Korea (North Korea), Republic of Korea (South Korea), Mongolia and eastern Russia) and Australasia (Australia, New Zealand and Papua New Guinea). In mainland China, Hong Kong SAR and Taiwan, the AWC has been coordinated separately, therefore information has been presented separately for these regions in this report (in keeping with previous reports). In addition, since 2015, information has been received from Palau, which hosts several migratory shorebird and other waterbird species covered by the East Asian - Australasian Flyway Partnership and is included within the SE Asia region in this report.

## Count Period

The AWC takes place once a year, during the second and third weeks of January. However, logistical difficulties in some countries or limited volunteer capacity mean that counts made at any time during January are accepted for the AWC database. In some countries, counts made during the northern (boreal) winter period from late November to February are accepted if no January data are available and it is evident that the populations of birds are stable in this area during this period.

## Sites and Species Coverage

The AWC covers all types of sites used by waterbirds, including natural and man-made wetlands, rivers, lakes, reservoirs, ponds, freshwater swamps, mangroves and tidal mudflats, coral reefs, rice fields, grasslands, sewage farms, etc. that are covered by the Ramsar Convention.

All waterbird groups encountered in the region, as recognised by the Ramsar Convention, are covered by the census. These include grebes, cormorants, pelicans, herons, egrets, storks, ibises,

spoonbills, flamingos, ducks, geese & swans (Anatidae), cranes, rails, jacanas, shorebirds, gulls and terns. Reporting tends to cover all groups of waterbirds from most parts of Asia, whereas Japan mainly submits counts of two main groups, Anatidae and shorebirds with additional information on selected crane and other species in some years. Counts from Australia and New Zealand are consistently submitted only for shorebirds, that form the main migratory group of waterbirds in this region.

In addition, counts of other wetland-dependent species (including seabirds, raptors, kingfishers, wagtails and pipits) that are regularly encountered in wetlands have been submitted by some countries, as several of these species depend largely on the food resources provided by these habitats. This gives a better indication of the wider importance of these sites, even though it is expected that the diversity and abundance of such species are not yet adequately recorded by participants across the region. Although this information is stored in the International Waterbird Census database, these birds are not included in the current report.

The sequence and nomenclature of waterbird species used in this report follows "The BirdLife checklist of the birds of the world: Version 9 (2016)", This checklist is increasingly being adopted by the biodiversity related conventions. Subspecies information has been included where possible. Reporting of subspecies differs between countries, so these entries should be interpreted with some caution. For more information please contact us or the relevant National Coordinators.

Species that are difficult to identify with certainty in the non-breeding plumage may be reported incorrectly, such as pond herons. For this reason, besides species totals, the report also provides totals of unidentified species of a group (for e.g. unidentified terns, gulls, herons, ducks, geese, ibises, storks) as well as unidentified waterbirds. The total number of waterbirds being reported at a site provide a valuable indication of its importance. Hence while it may not always be possible to identify every species, recording the total number of waterbirds to group level is important.

The taxonomy of 'large white-headed gulls' in the region remains an ongoing process of evolution. Differences in the way that this group is treated in the various field guides mean that a species may be identified and reported differently by different observers. It is recommended that the numbers reported of these species is treated with caution.

Wetlands International relies on its network of coordinators to review all species identification and unusual counts, although it is impossible to verify all the observations submitted.

## Red List Status

BirdLife International leads on the update of the status of the world's threatened birds. It is the official Red Listing Authority on birds, and supplies this information for the IUCN (World Conservation Union) Red List of Threatened Species. This report follows Red List (2016) based on the standard IUCN Red List Categories (IUCN 2001) as follows: Extinct (EX), Extinct in the Wild (EW), Critically Endangered (CR), Endangered (EN), Vulnerable (VU), and Near Threatened (NT). Other categories are Least Concern (LC), Data Deficient (DD) and Not Evaluated (NE). The abbreviation NR in the report refers to unidentified species and species groups.

## Overview of Results

### Number of Visits

This report collates information submitted to Wetlands International to cover the northern hemisphere winter seasons between 2008 and 2015. Information has been received for a minimum of 1,146 sites in 2009 and a maximum of 1,433 in 2015 (details in Table 1).

During this period, counts were received from all the countries/regions in the region, with the exception of Laos, the Maldives, Democratic People's Republic of Korea and Papua New Guinea. In 2015, information has also been received from Palau, which hosts migratory shorebird and other waterbird species and is included within SE Asia in this report.

<b>Total</b>	<b>1,177</b>	<b>1,146</b>	<b>1,301</b>	<b>1,368</b>	<b>1,308</b>	<b>1,273</b>	<b>1,433</b>	<b>1,293</b>

**Note:** The figures represent the number of sites actually recorded in the AWC database and may differ from the number presented in earlier reports or those appearing in national reports and

overviews. Some sites may have been combined into larger sites for standardisation purposes. A small number of site with doubtful counts or with very few bird records have been removed.

Fig 1: Overview of sites per region reported during the AWC 2008-2015

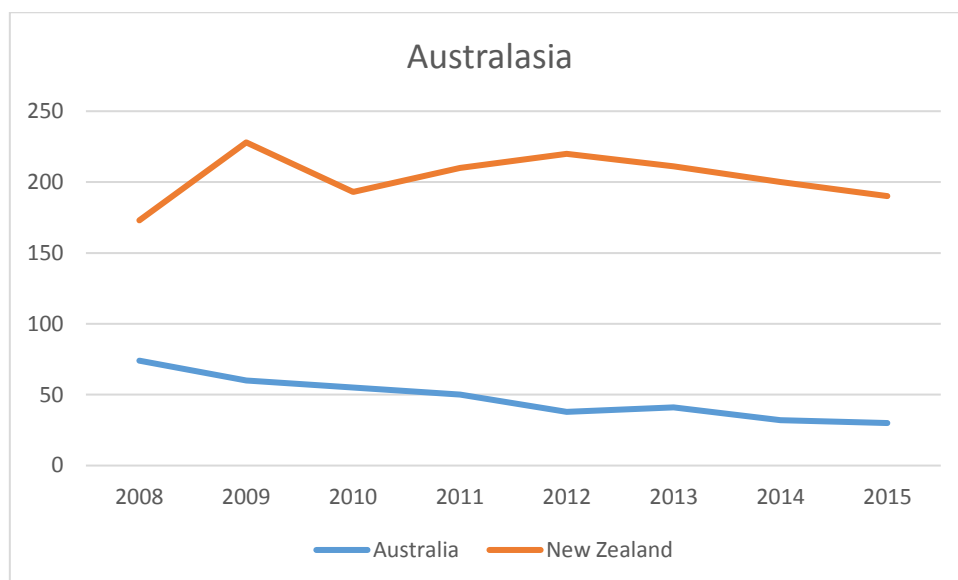

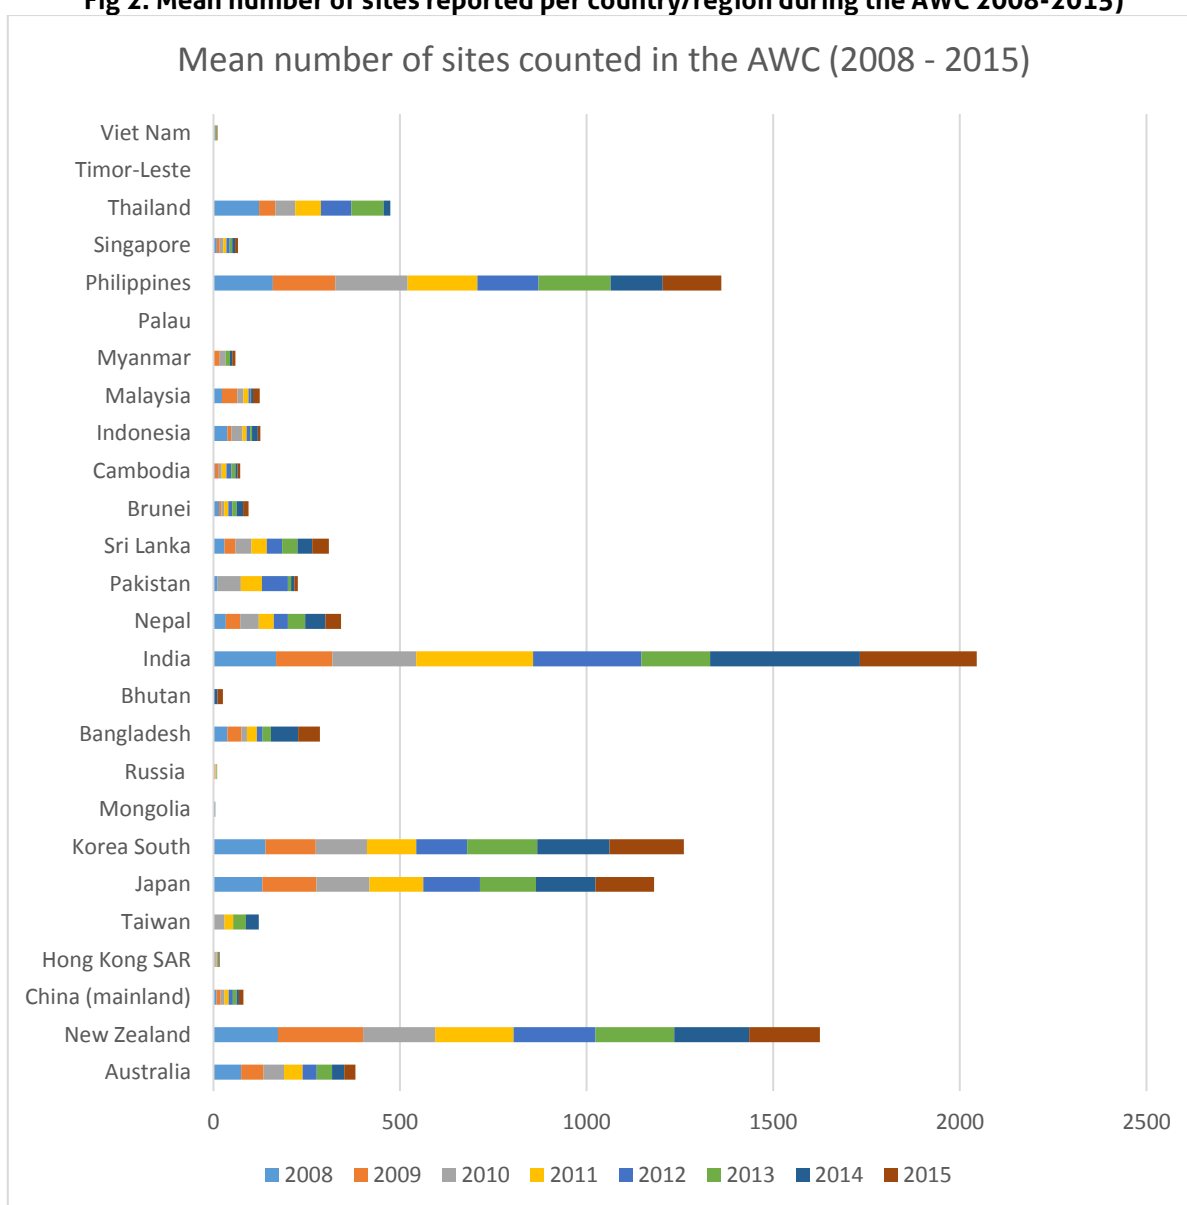

Fig 2: Mean number of sites reported per country/region during the AWC 2008-2015)

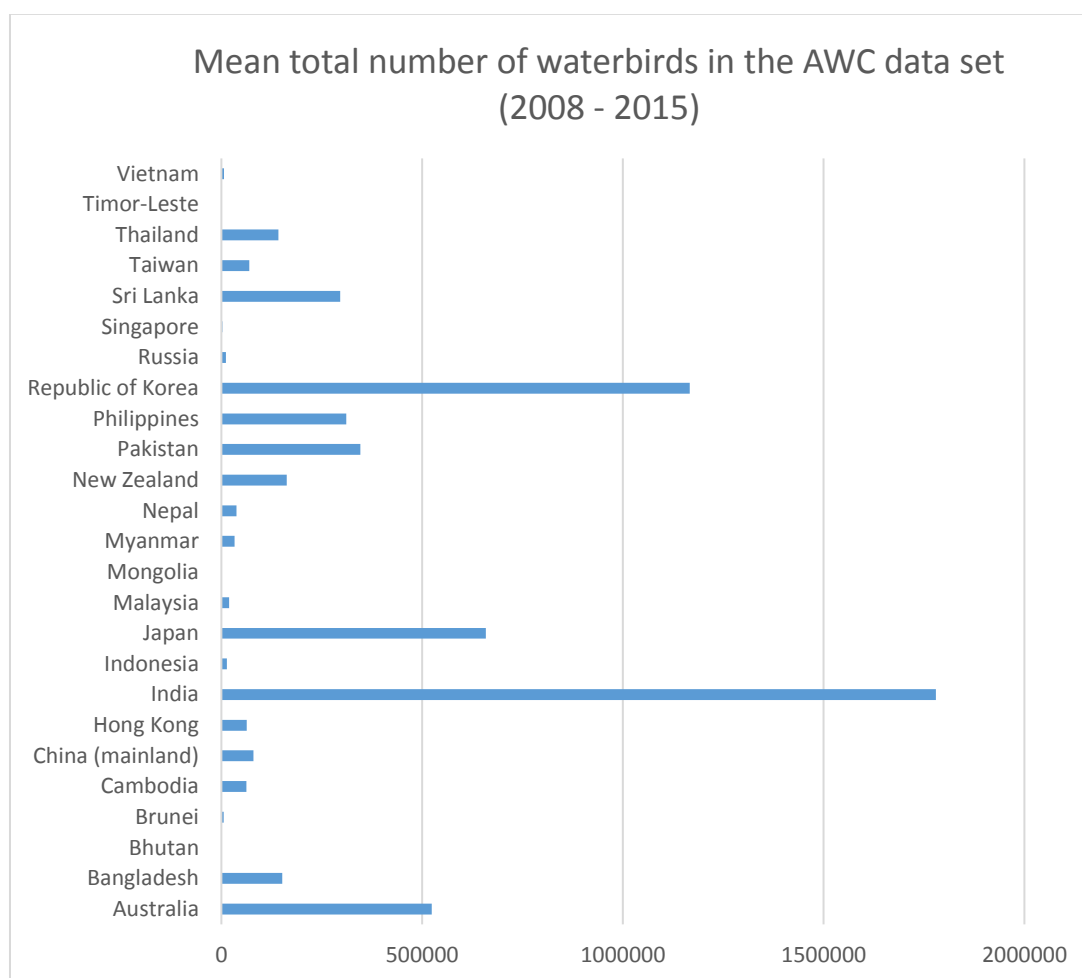

## Overview of Counts

During this period, counts were received from all the countries/regions, with the exception of Laos, the Maldives, North Korea and Papua New Guinea. The total number of waterbirds reported varied between nearly 5.5 and 7.5 million across the region (Table 2). India and South Korea reported the largest average number of waterbirds annually. In South Korea this is a reflection of the high level of coverage of sites whereas in India it is largely dependent on the selection of sites being covered in that year.

**Table 2. Total number of waterbirds reported during the Asian Waterbird Census 2008-2015**

Country/region	2008	2009	2010	2011	2012	2013	2014	2015

Fig 3: Overview of waterbirds reported during the AWC 2008-2015 (as at 20 Nov 2016)

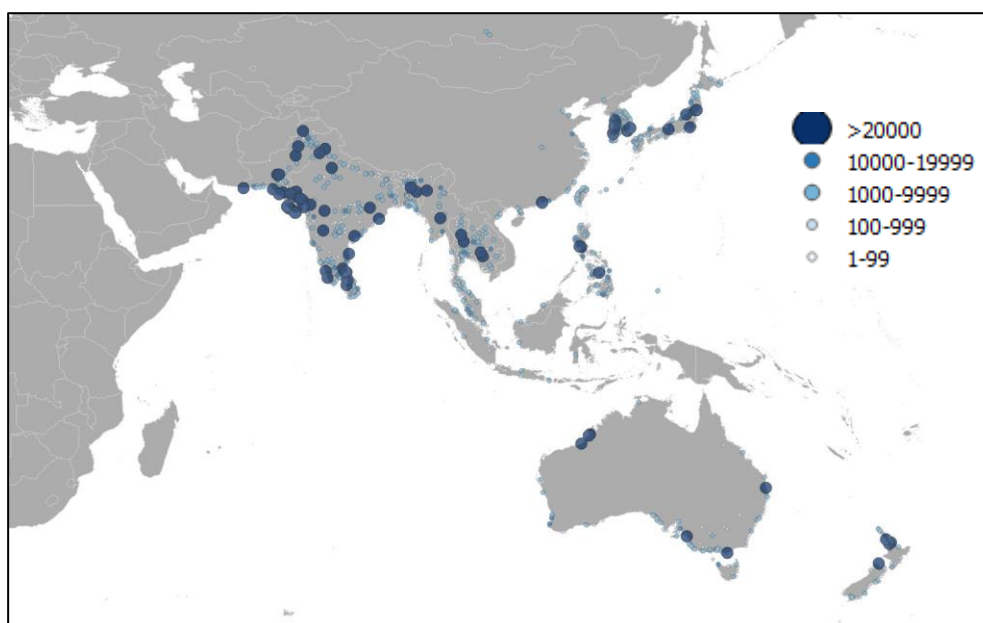

### Important Sites

The report covers information from a range of sites, with Chilika Lake in India reporting the maximum number (over 800,000 waterbirds). A large number of sites meet the Ramsar Convention and East Asian – Australasian Flyway Partnership criterion of “international importance” and, in that they regularly support over 20,000 waterbirds, based on counts during the northern hemisphere winter.

The map below provides an overview of the average numbers of waterbirds reported during the 2008-2015 census periods. Sites with large numbers of waterbirds are reported from across the region, particularly, in Australia, Bangladesh, Cambodia, India, Japan, New Zealand, Pakistan, Philippines, Sri Lanka, Thailand and South Korea. In some regions, sites are often reported as smaller count units, rather than at administrative or management units such as protected areas, Ramsar sites, or Flyway Network Sites (see next).

Many other sites qualify as important during the migration or breeding periods and need to be assessed through other monitoring programmes.

Fig 4: Overview of average number of waterbirds per site reported during the AWC 2008-2015 (as at 20 Nov 2016)

### EAAFP Flyway Network Sites

The EAAFP has developed an international network of wetlands of international importance for migratory waterbirds, currently spanning 125 sites in 17 countries from arctic Russia and Alaska to Australia and New Zealand. A majority of these sites (56%) are being covered during the AWC (see Table 3), with the exception of sites in northern Russia, Alaska and Mongolia that are frozen during January. A full list of sites covered is included in Annex 1.

Table 3. Coverage of EAAFP Network Sites during the AWC 2008-2015

Country/region	Number of EAAFP Network Sites	Reported in AWC - 2008-2015	Percentage of EAAFP Network sites covered in AWC
Australia	21	12	57
Bangladesh	5	5	100
China	19	4	21
Indonesia	2		0
Japan	33	27	82
Malaysia	2	2	100
Mongolia	6		0
Myanmar	3	2	67
New Zealand	2	2	100
DPR Korea	2		0
Papua New Guinea	1		0
Philippines	3	2	67
Russia	10		0
Singapore	1	1	100
Republic of Korea	11	10	91
Thailand	3	3	100
USA (Alaska)	1		0
<b>Total</b>	<b>125</b>	<b>70</b>	<b>56</b>

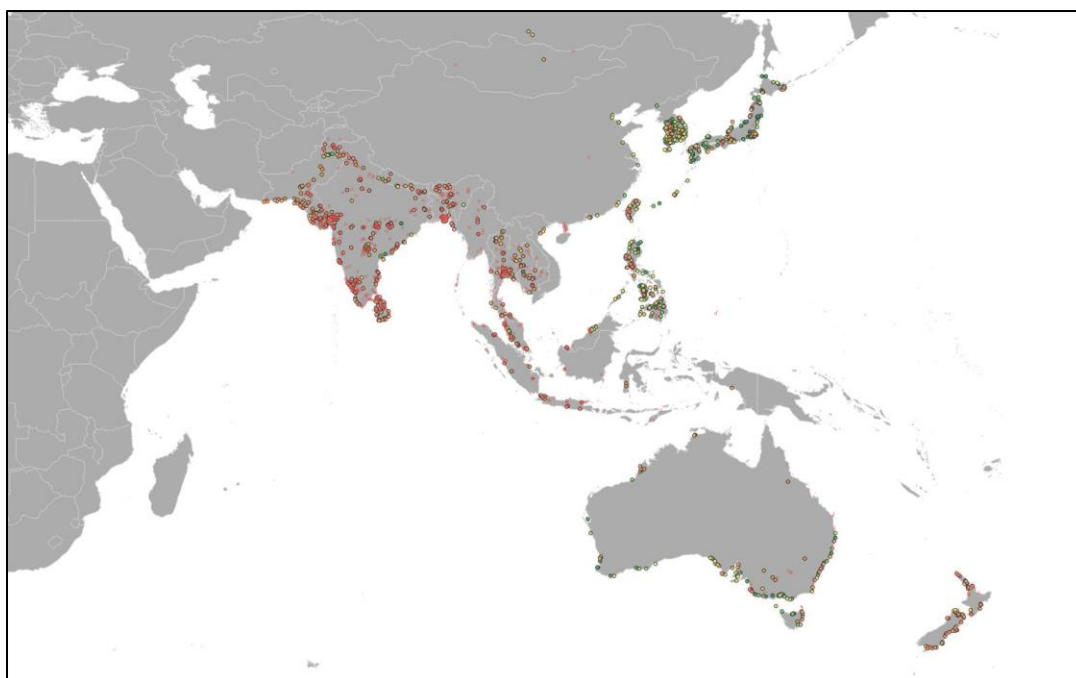

*(Note: Table 3 includes Flyway Network Sites in DPR Korea and Papua New Guinea. These sites were nominated during the period of the Asia Pacific Migratory Waterbird Conservation Strategy and have yet to be formally reconfirmed by the National Governments as part of the EAAFP Flyway Site Network.)*

## Annual Site Coverage

The value of monitoring of waterbirds is enhanced when a representative set of sites is covered regularly. Reporting during the last eight years has varied considerably between countries and sites. Within the EAAF, reporting has been most consistent (7 or 8 seasons) in Brunei, Japan, South Korea, Singapore, the Philippines and parts of the coast of mainland China, Hong Kong SAR, Australia, Malaysia, Thailand and Russia (Fig. 5). Reporting has been comparatively more patchy elsewhere (Bangladesh, Cambodia and Mongolia), with the first reports being submitted from Timor-Leste and Palau.

Within the Central Asian Flyway, reporting has been most consistent in parts of Nepal, Sri Lanka and several states in India, with comparatively more patchy coverage in many states of India, with the first reports being submitted from Bhutan after several years. Coverage of sites in southern Russia and Mongolia are dependent on ice conditions.

**Fig 5: Overview of number of years reports were received for sites during the AWC 2008-2015**

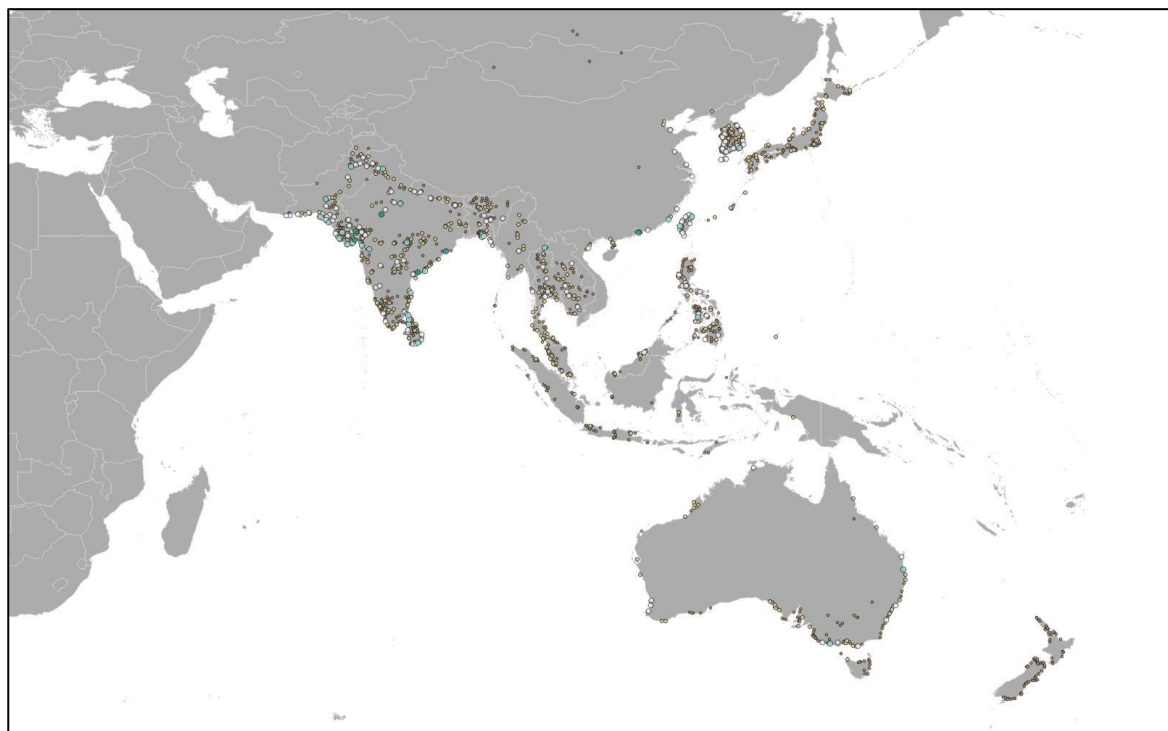

## Species Diversity

The sites with average highest species diversity were recorded from India and South Korea, followed by sites in Sri Lanka and Hong Kong SAR (Fig. 6).

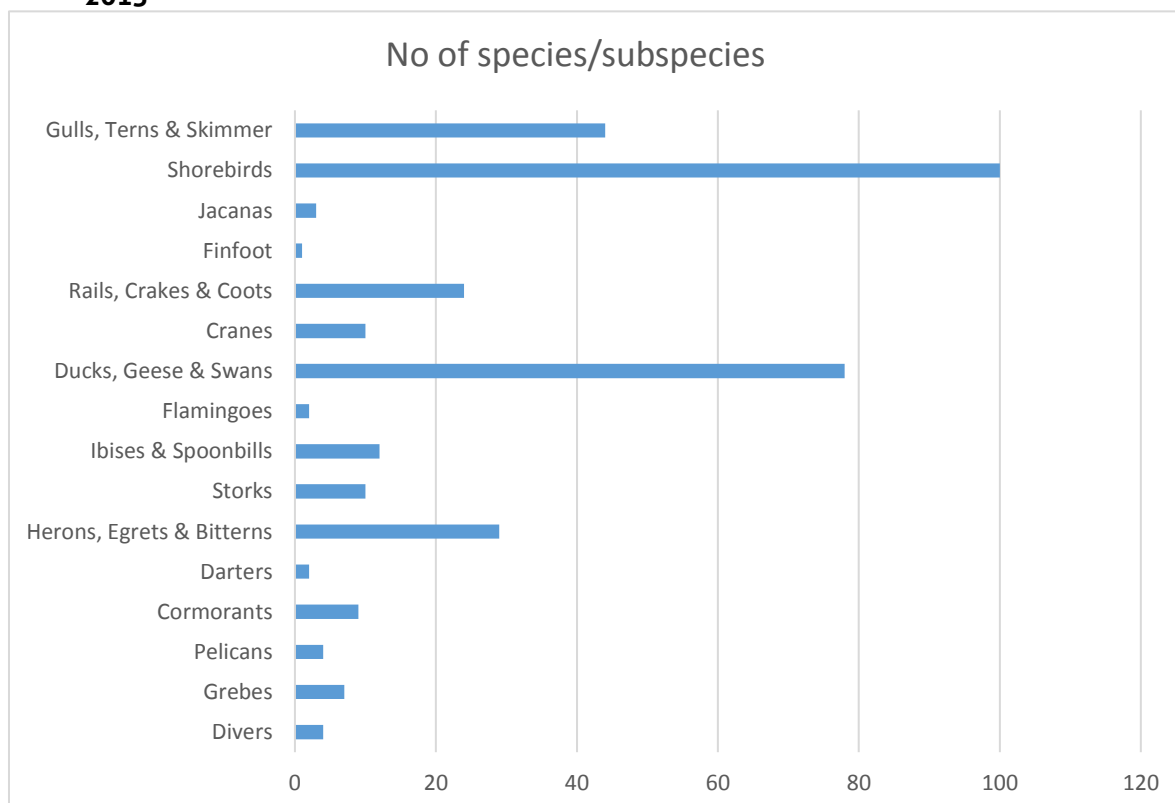

A summary of the numbers of waterbirds reported per country/region in each year is provided in Annex 2 with details per country/region in Annex 3.

**Fig 6: Overview of average number of waterbird species per site reported during the AWC 2008-2015**

The main groups of waterbirds were shorebirds, Anatidae (ducks, geese & swans), Gulls, Terns and Skimmer and Herons, Egrets & Bitterns (Fig 7). In Australia, shorebirds were reported each year. Other waterbird families were only reported in 2008.

**Fig 7: Overview of average number of species per waterbird group reported during the AWC 2008-2015**

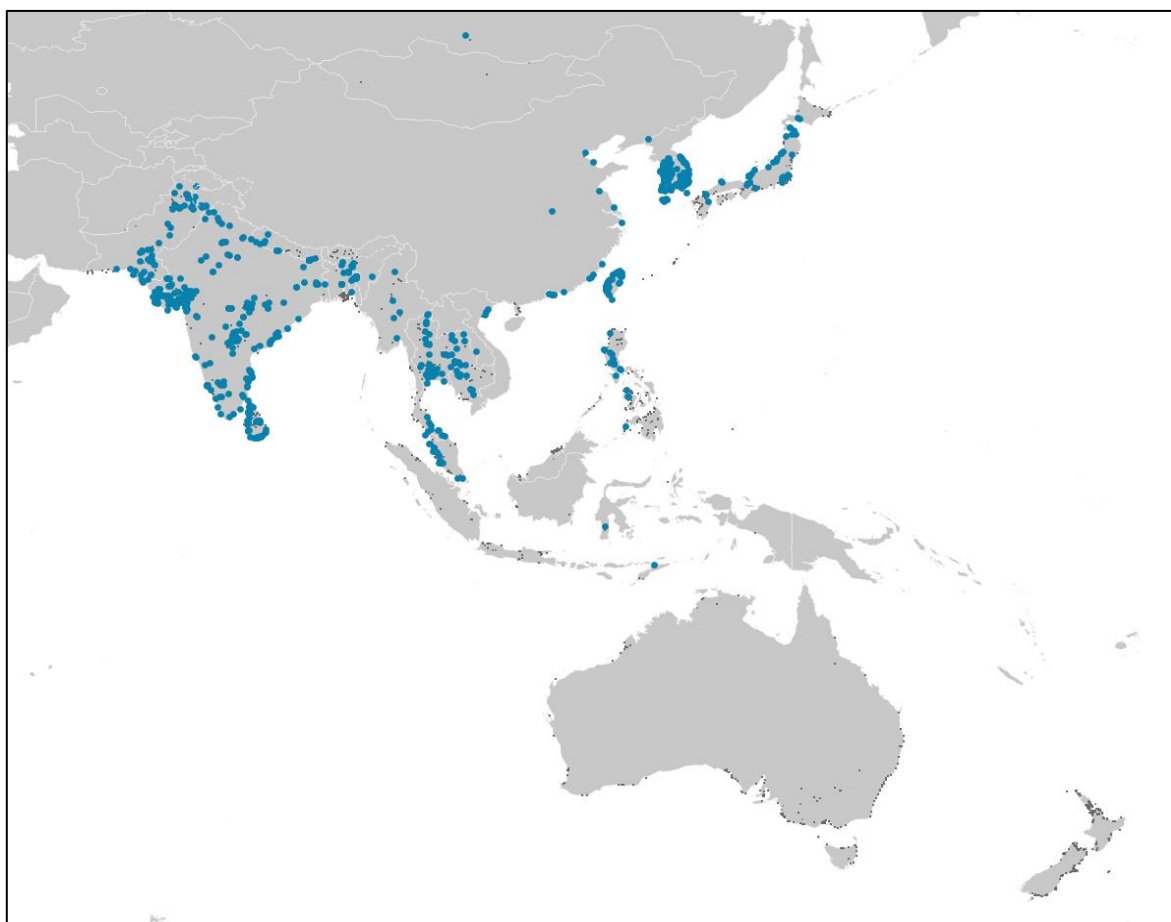

## Selected Species Overview

This section provides short summaries for selected species to cover the spectrum of waterbird families (grebes, cormorants, pelicans, herons, egrets, storks, ibises, spoonbills, flamingos, ducks, geese & swans (Anatidae), cranes, rails, jacanas, shorebirds, gulls and terns) submitted in the annual counts with information and maps for one or more species. The maps indicate sites where the species was reported. Sites visited but where the species was not reported are indicated with a grey dot. Species identified as [key species](#) by the EAAFP are included. These are primarily threatened, some of which are covered by Single Species Action Plans of the EAAFP and CMS. These include: Black-faced Spoonbill, Spoonbilled Sandpiper, Eurasian Spoonbill, Far Eastern Curlew and Great Knot, with the exception of the Siberian Crane as the main counts have not been received during this period. The population estimate for the species follows Waterbird Population Estimates 5<sup>th</sup> edition (WPE) (Wetlands International 2012).

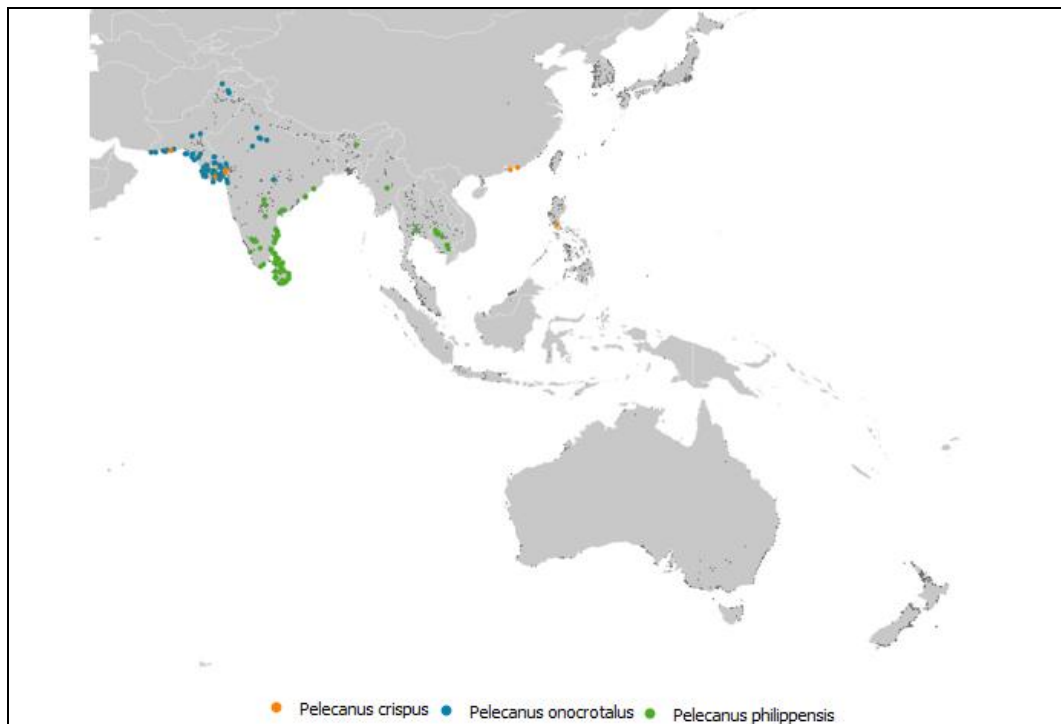

### Grebes

The Little Grebe *Tachybaptus ruficollis* LC is the most widespread of the group, being reported in E (from lake Baikal southwards), S and SE Asia in inland and coastal wetlands, with between 8,800-33,000 reported annually (WPE 200,000-2,000,000).

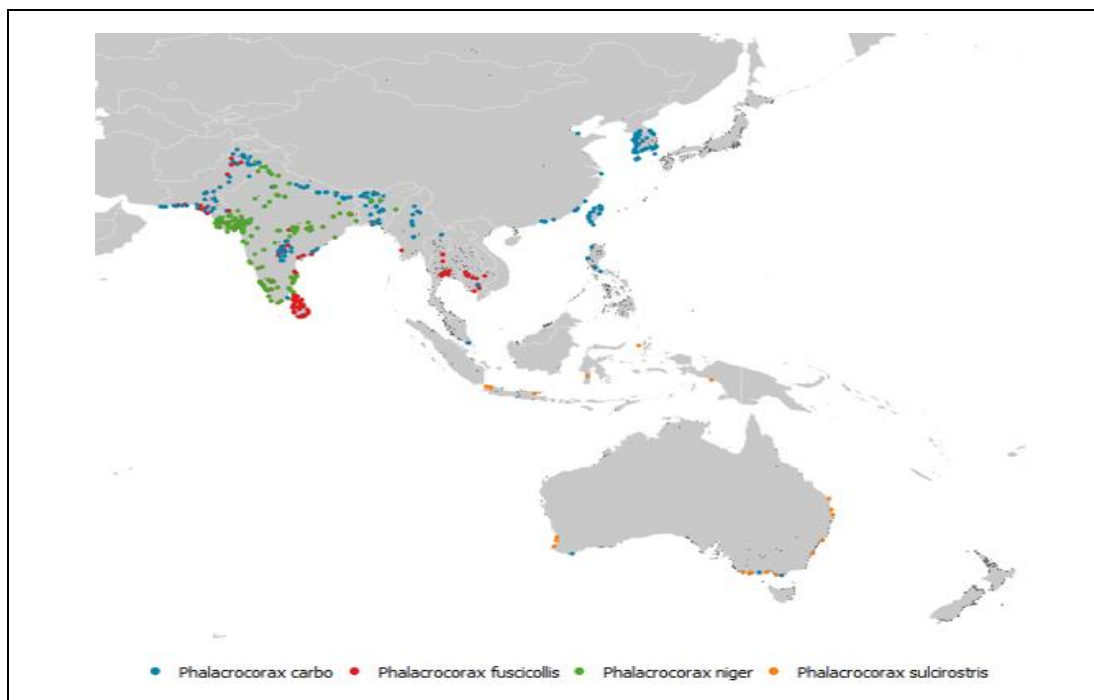

### Pelicans

Four pelican species are reported during the counts, including Dalmatian Pelican *Pelecanus crispus*, VU between 7,200-17,800 reported annually (WPE 30,000). The Spot-billed Pelican *Pelecanus philippensis* NT between 4,800-17,400 reported annually (WPE 13,000-17,000) from across South Asia and the more localised Southeast Asia population.

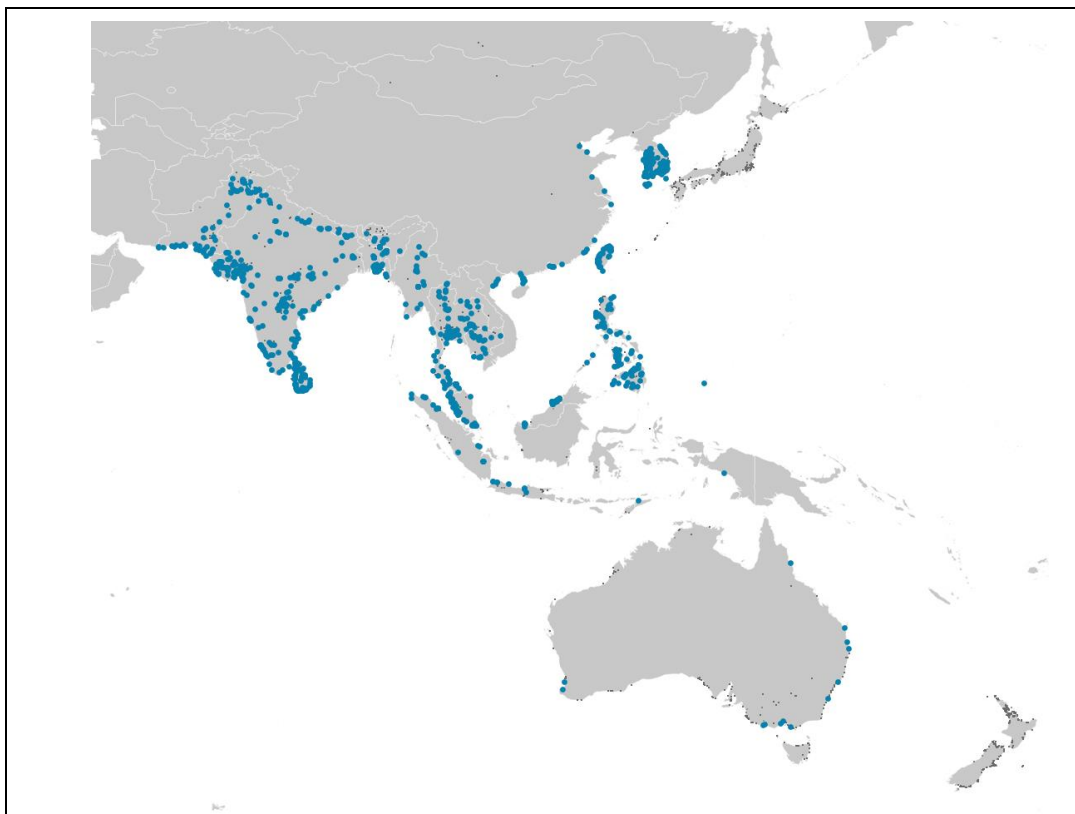

### Cormorants

For this report, four species in Asia and Australasia are depicted. Great Cormorant *Phalacrocorax carbo* between 23,000-76,300 reported annually (WPE 100,000-260,000), Indian Cormorant *Phalacrocorax fuscicollis* between 7,200-17,800 reported annually (WPE 30,000), Little Cormorant *Phalacrocorax niger* between 23,210-70,800 reported annually (WPE 275,000-350,000), Little Black Cormorant *Phalacrocorax sulcirostris* between 4-1,400 reported annually (WPE 25,000-1,000,000).

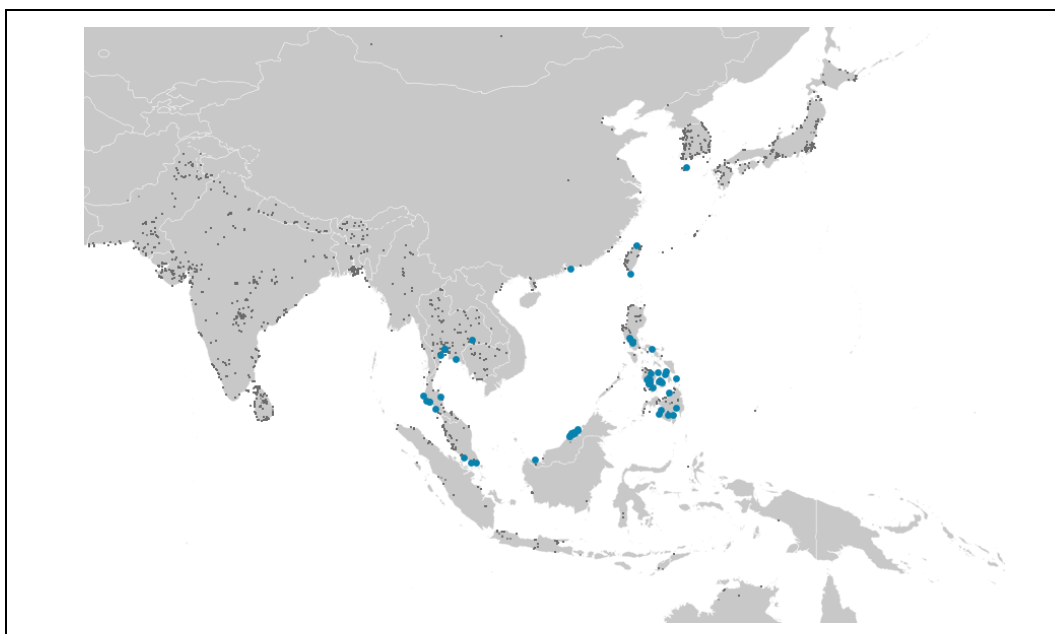

### Herons, egrets,

Great White Egret *Ardea alba* LC between 13,400-31,000 reported annually (WPE 60,000-300,000)

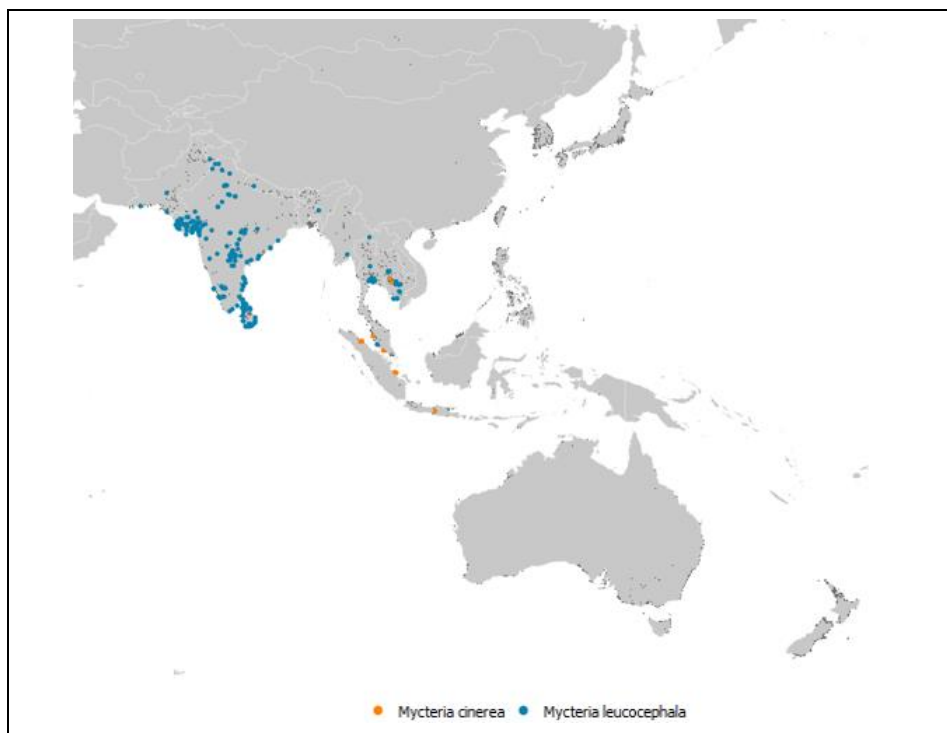

The Chinese Egret *Egretta eulophotes* VU between 100-500 reported annually (WPE 3,000 - 4,100).

### Storks

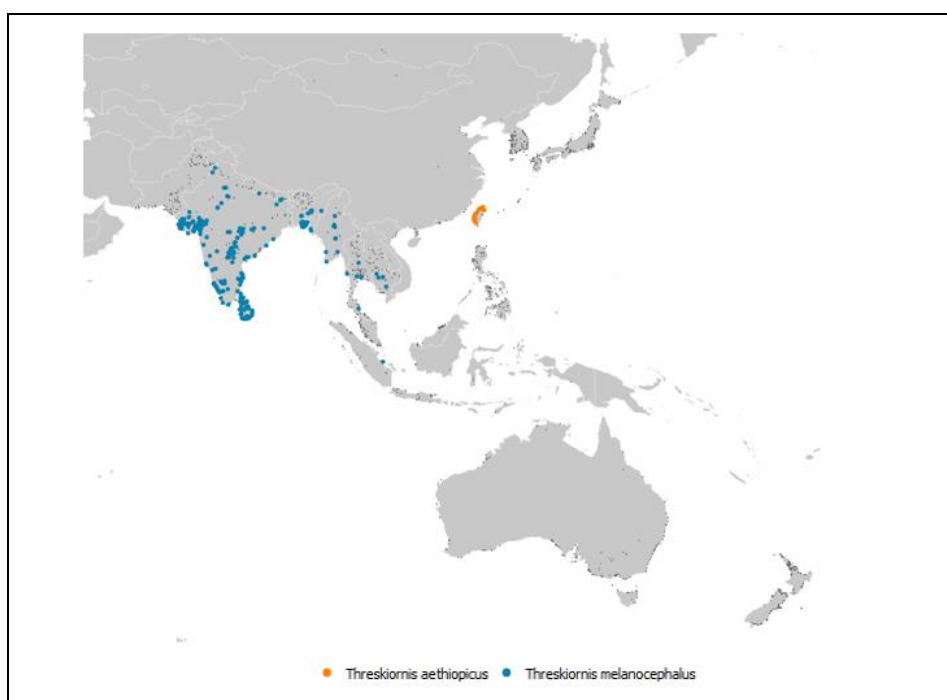

The region is home to 11 stork species, including five threatened species; Greater Adjutant, Milky Stork, Oriental Stork and Storm's Stork that are listed as EN, Lesser Adjutant and Asian Woollyneck listed as VU, as well as the Painted Stork and Black-necked Stork listed as nt. The rare forest Storm's Stork of SE Asia is not reported during this period.

Of the two species featured here, Milky Stork *Mycteria cinerea* EN between 1-200 (WPE 30-5,040) was reported in its strongholds of Cambodia, Indonesia and Malaysia. The Painted Stork was reported across S and parts of SE Asia, although numbers have declined in recent years; between 5,800-21,700 were reported annually (WPE 25,000-35,000).

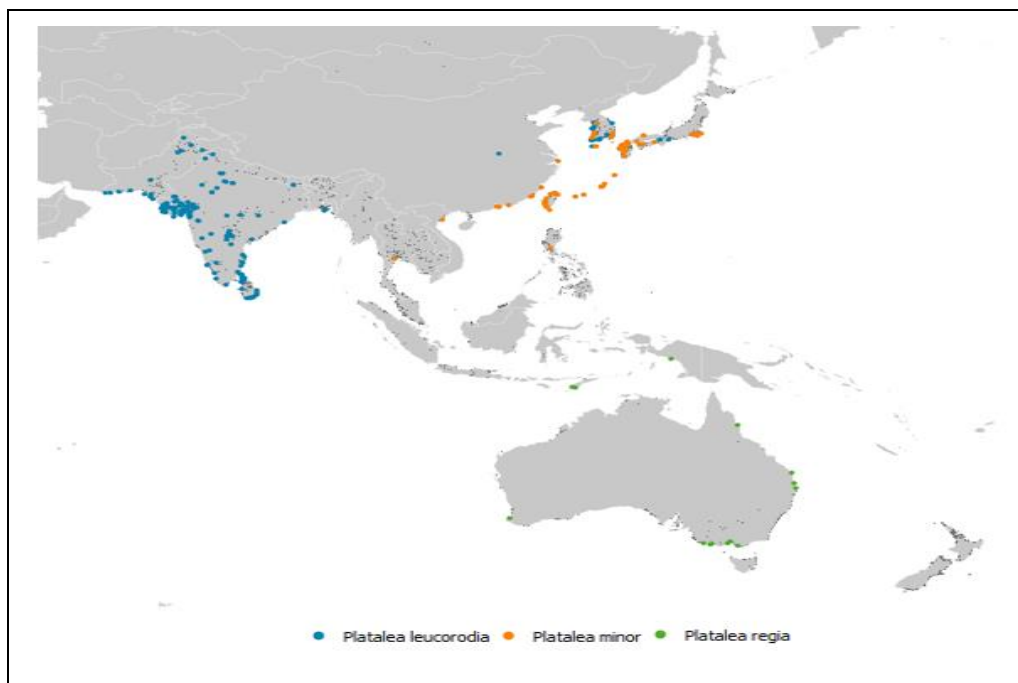

### Ibises & Spoonbills

The region has eight native ibis species and one introduced species. Of these, the White-shouldered Ibis and Giant Ibis are CR and were reported only in their stronghold of Cambodia. Of the four species featured here, the Black-headed Ibis NT is reported across most of its S & SE Asian range. The Australian Ibis and Straw-necked Ibis were reported only in one year in Australia while reporting has been too limited in eastern Indonesia and PNG where they also occur. The introduced African Sacred Ibis is now reported across Taiwan. The EN Crested Ibis is not reported during the census.

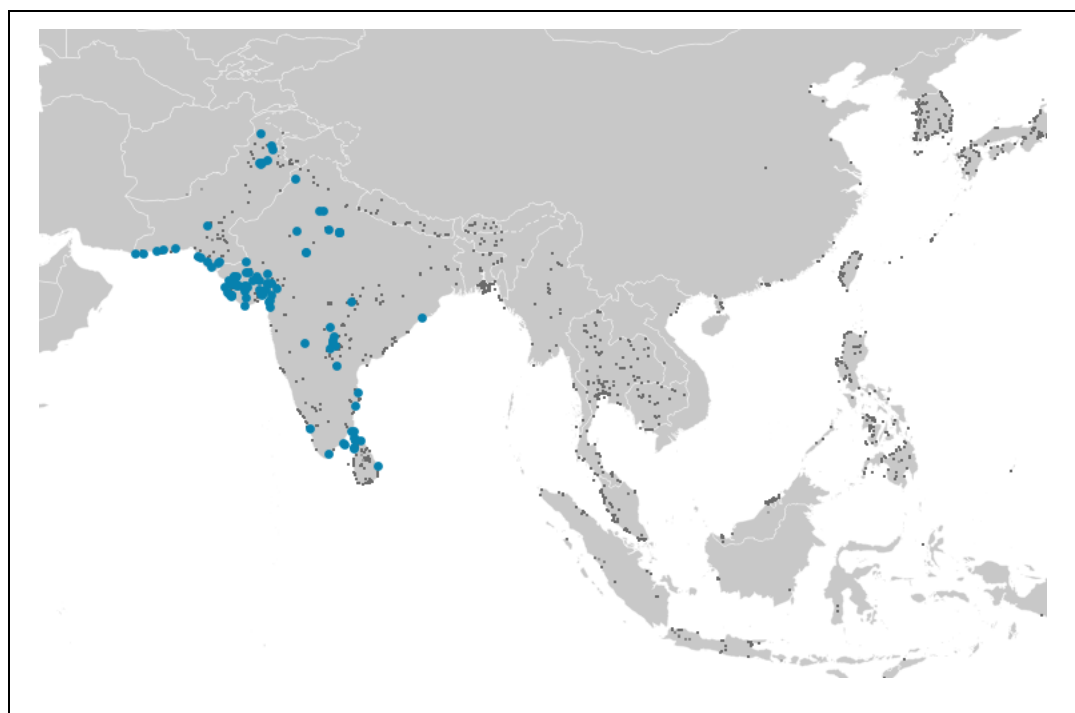

The Spoonbill family in the region covers four species, including two species of special interest. The Black-faced Spoonbill *Platalea minor* EN in E Asia covered under a BirdLife International and CMS conservation plan. It has been widely reported across its range and is a success story with the population increasing with a maximum of 2,511 reported in 2015 (WPE 1,830 - 2,700) as a result of local and regional conservation action. The Eurasian Spoonbill LC was reported in S, SE and E Asia with between 2,000 and 8,000 annually (WPE pop 33,000) and is covered by a global conservation plan by CMS and AEWA (Triplet et al 2008).

### Flamingos

Both, the Greater Flamingo *Phoenicopterus roseus* LC and Lesser Flamingo *Phoeniconaias minor* NT were reported widely across their inland and coastal ranges in S Asia. For the Greater Flamingo depicted here, between 15,000 and 94,000 were reported annually (WPE 240,000).

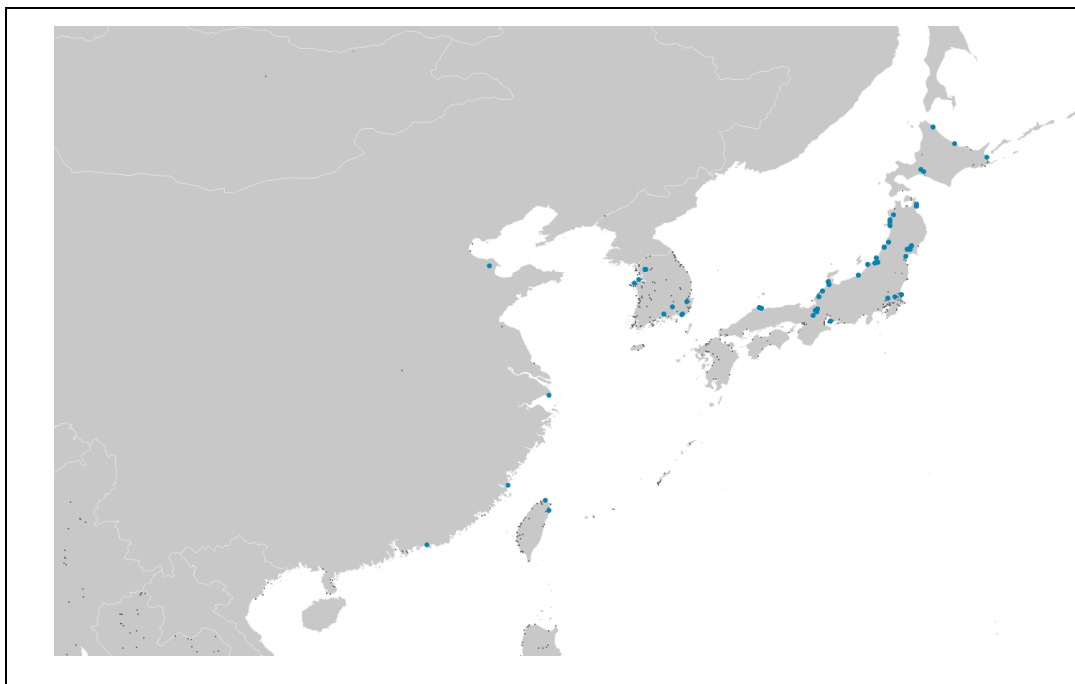

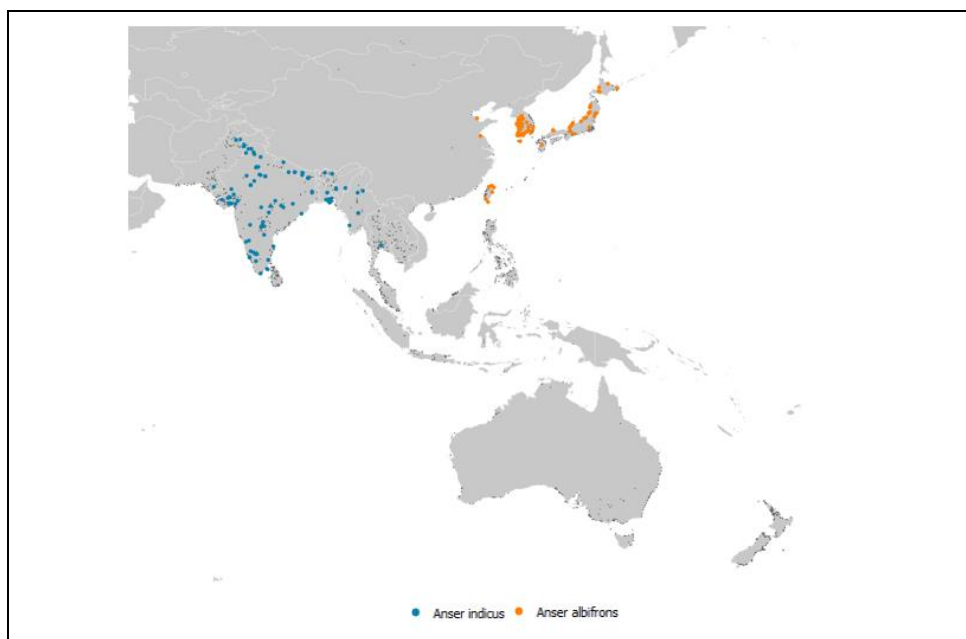

### Swans, Geese and Ducks (Anatidae)

This is a large and diverse group of waterbirds, including many threatened species. The group is well covered by the AWC, especially those that use open coastal and inland wetlands. Forest species like the White-winged Wood Duck, the riverine Scaly-sided Merganser CR and seaducks (Scoter and Eiders) were not widely reported.

Of the four swan species, none are listed as threatened. Depicted here is the Bewick's Swan *Cygnus columbianus bewickii* LC of E Asia (non-breeding), which was most widely distributed and between 18,000-25,000 reported annually (WPE 93,000-120,000).

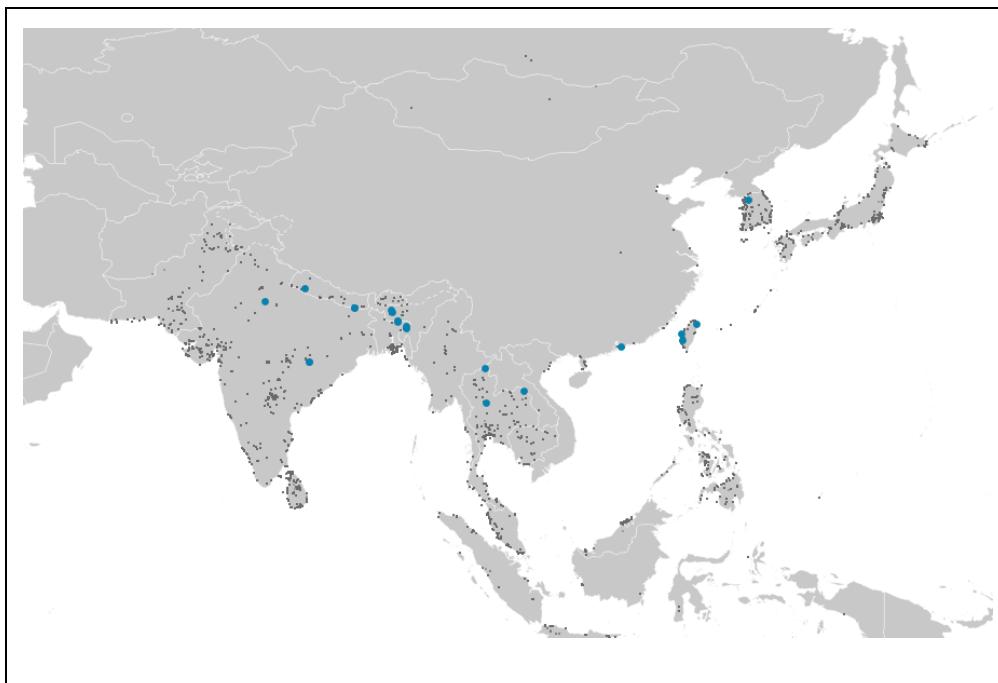

Eleven geese species occur in the Asian region, including two VU species, Swan Goose and Lesser White-fronted Goose. While the subspecies of Bean Goose are complex, they are reported as Taiga Bean Goose *Anser fabalis middendorffii* and Tundra Bean Goose *Anser fabalis serrirostris*, particularly in E Asia. Depicted here are the Greater White-fronted Goose *Anser albifrons* widespread in E Asia and Barheaded Goose widespread in S Asia. Between 680-89,100 Barheaded Goose *Anser indicus* reported annually (WPE 52,000-60,000) Greater White-fronted Goose 198,000-304,000 reported annually (WPE 263,000-328,000).

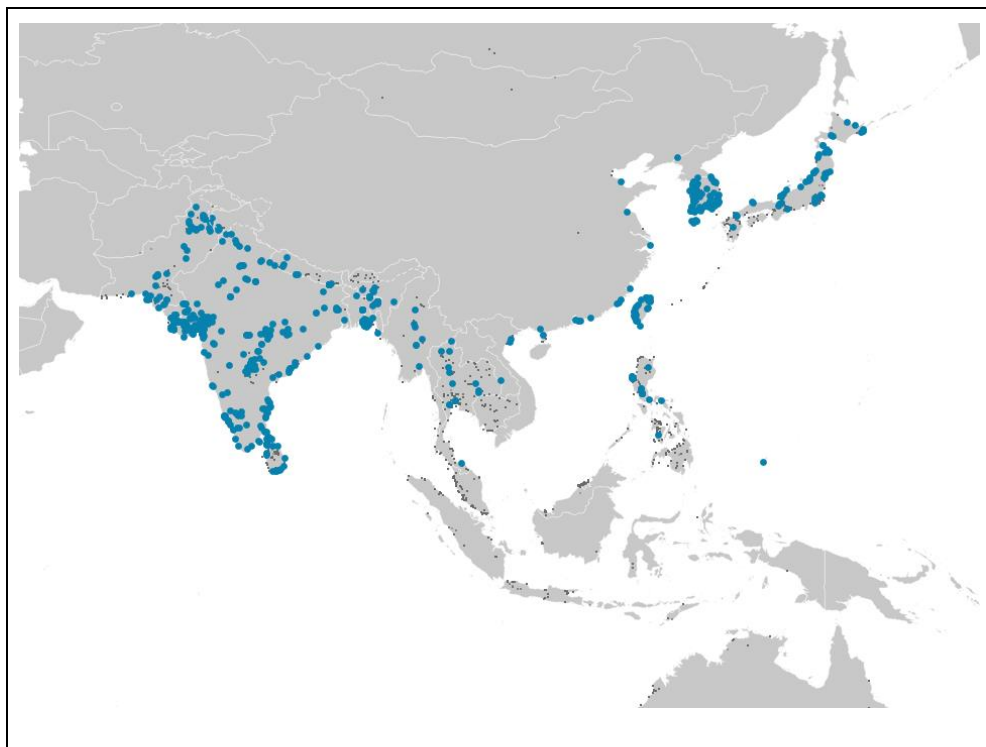

The Baikal Teal *Sibirionetta formosa*, the most numerous duck reported in the census is restricted to E Asia and numbers have fluctuated widely during this period between 316,000-1,065,000 (WPE 500,000-1,000,000).

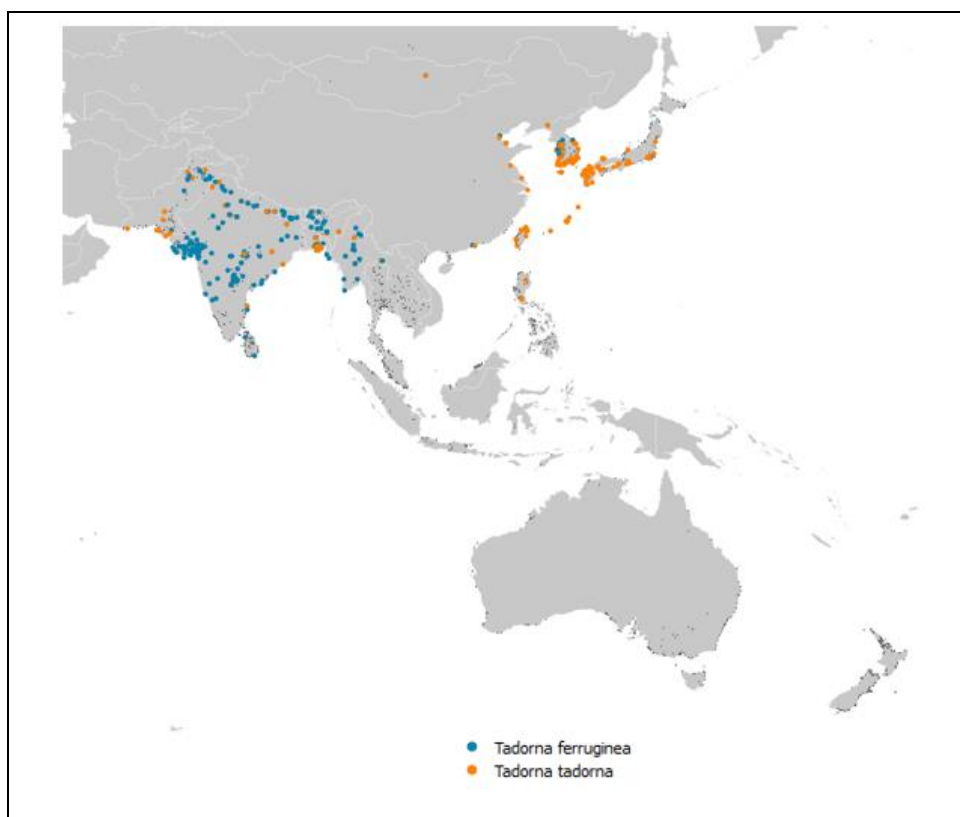

Of the diving ducks *Aythya*, the CR Baer's Pochard *Aythya baeri* of E, S and SE Asia is depicted here. Between 1-422 were reported annually (WPE 250 - 1,000), although the species is difficult to identify and may be overlooked or misidentified..

Of the widespread dabbling duck *Anas* species, the Northern Pintail (depicted here) was widely reported in E, SE and S Asia with between 79,000-521,000 reported annually (WPE 1,200,000-1,300,000)

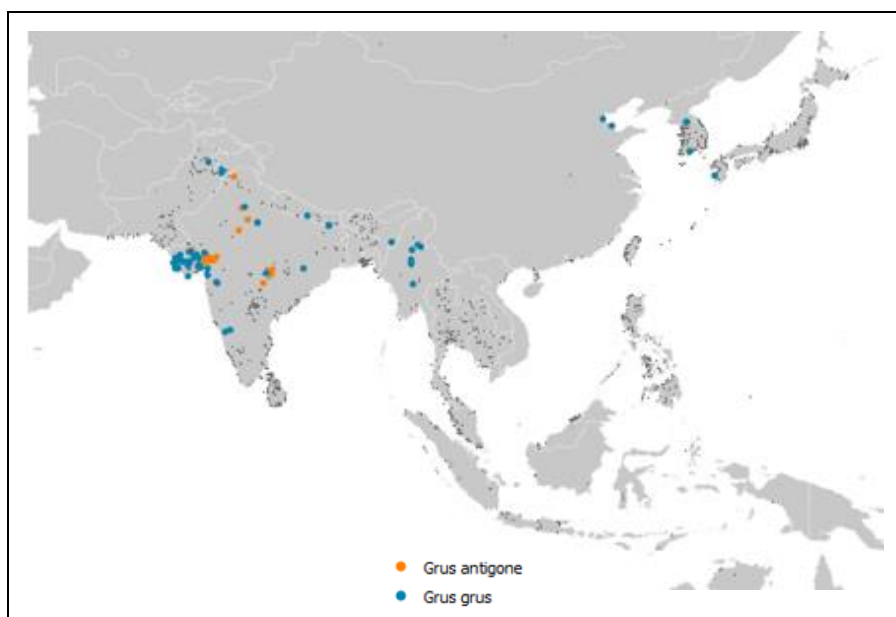

Depicted here are Common Shelduck *Tadorna tadorna* and Ruddy Shelduck *Tadorna ferruginea* of the six *Tadorna* family in the region. Both are widely reported in E, SE and S Asia. Between 25,000-39,000 Common Shelduck (WPE 125,000-250,000) were reported annually, while between 12,000 and 40,000 Ruddy Shelduck reported (WPE 100,000-150,000).

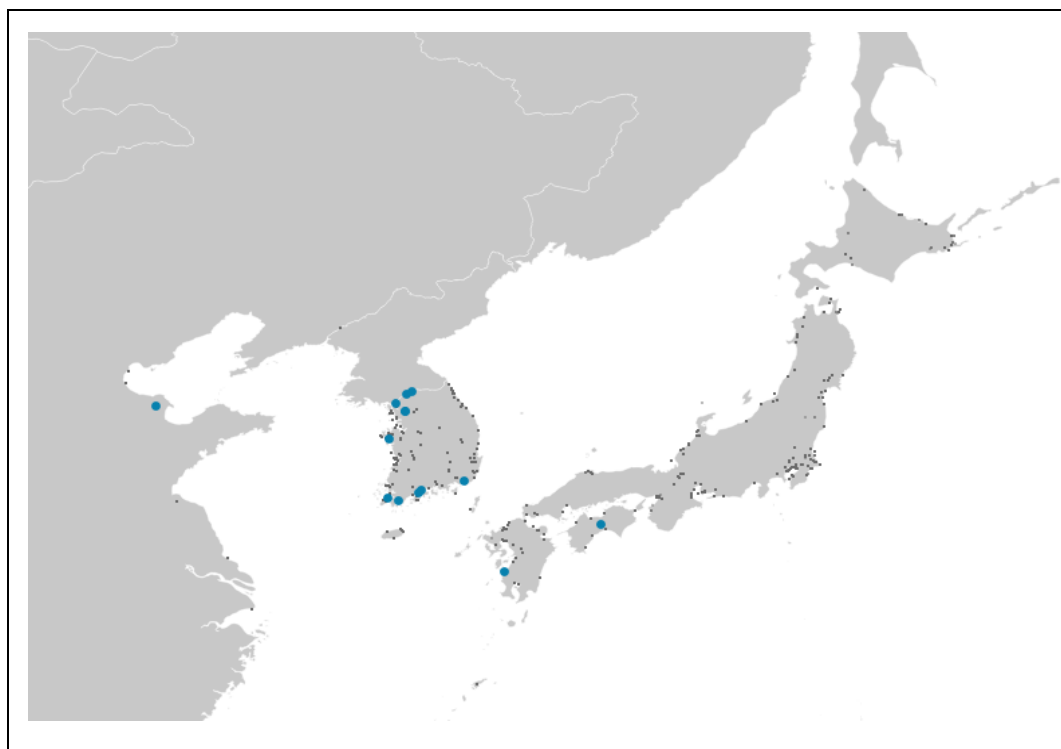

### Cranes

Of the nine cranes species, the Siberian Crane *Leucogeranus leucogeranus* CR, Red-crowned Crane *Grus japonensis* EN, White-naped Crane *Antigone vipio*, Hooded Crane *Grus monacha*, Black-necked Crane *Grus nigricollis* and Sarus Crane *Antigone antigone* are VU and Demoiselle Crane *Anthropoides virgo*, Common Crane *Grus grus* and Sandhill Crane *Antigone canadensis* are LC. Of the two depicted species, Sarus Crane between 100-800 reported annually in S Asia (WPE 8,000-10,000).

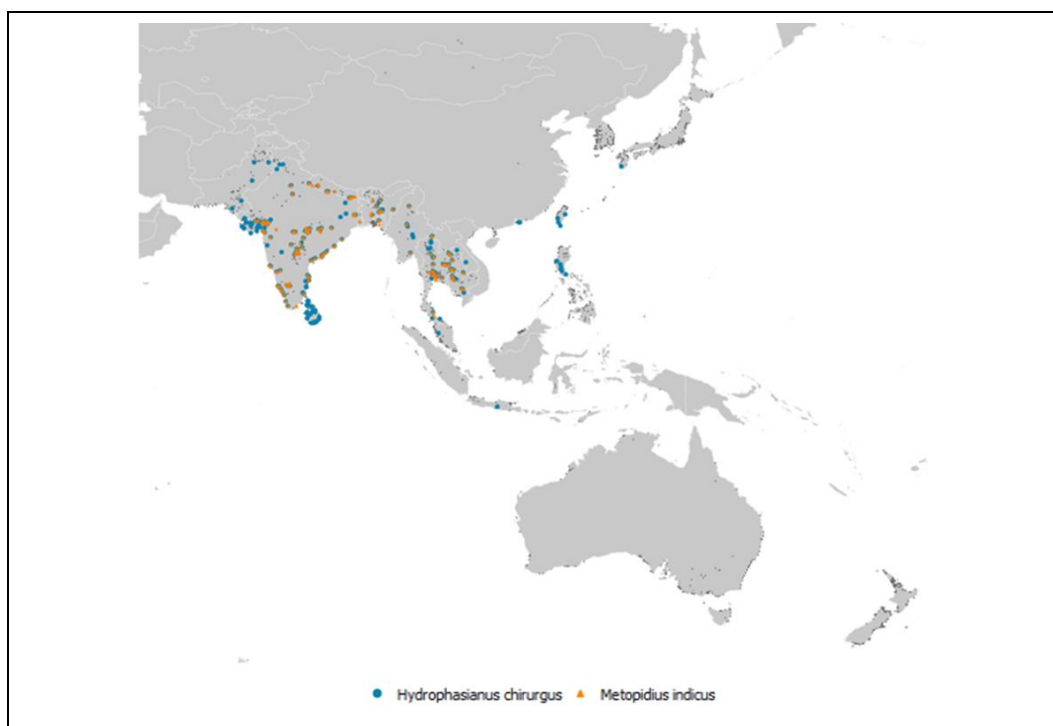

Of the two E Asian VU crane species most widely reported in the census, White-naped Crane (depicted here) between 1,400-4,200 (WPE 5,500-6,500) and Hooded Crane 300-11,300 (WPE 11,550-11,650).

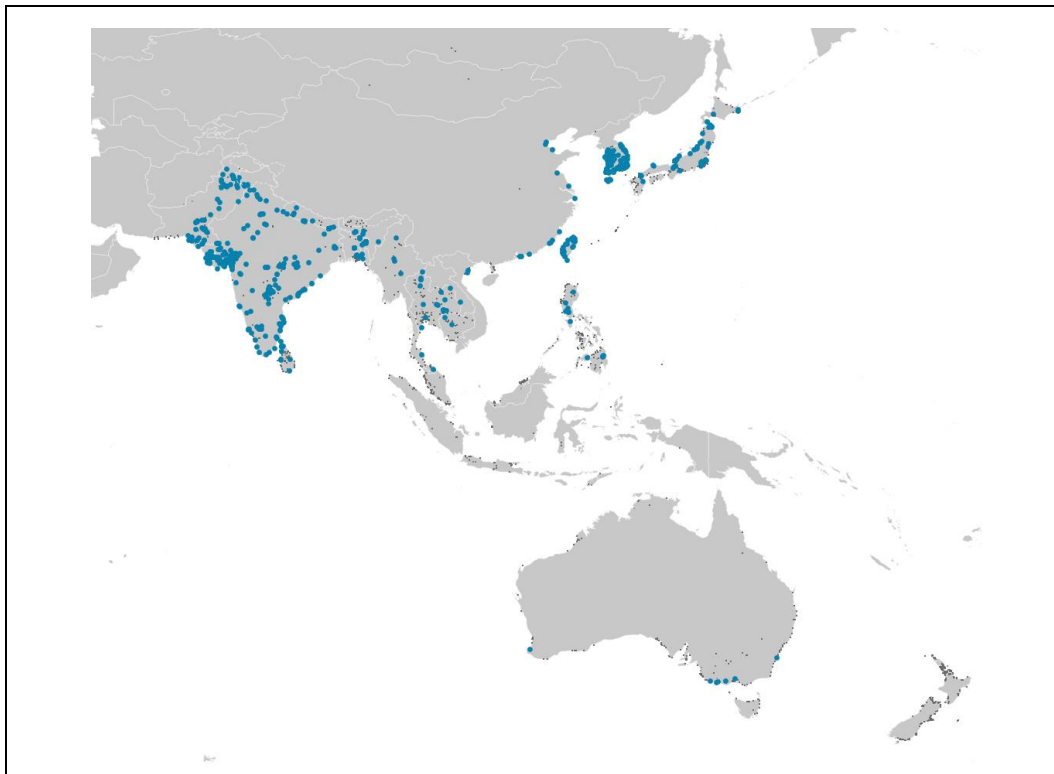

### Jacanas

Three Jacana species occur in the region, two in Asia and one in Australasia to eastern Indonesia. Depicted here are the Pheasant-tailed Jacana *Hydrophasianus chirurgus* in E, S and SE Asia, between 2,900-10,900 reported annually (WPE 100,000-150,000) and Bronze-winged Jacana *Metopidius indicus* in S and SE Asia, between 1,200-6,600 reported annually (WPE 50,000-100,000).

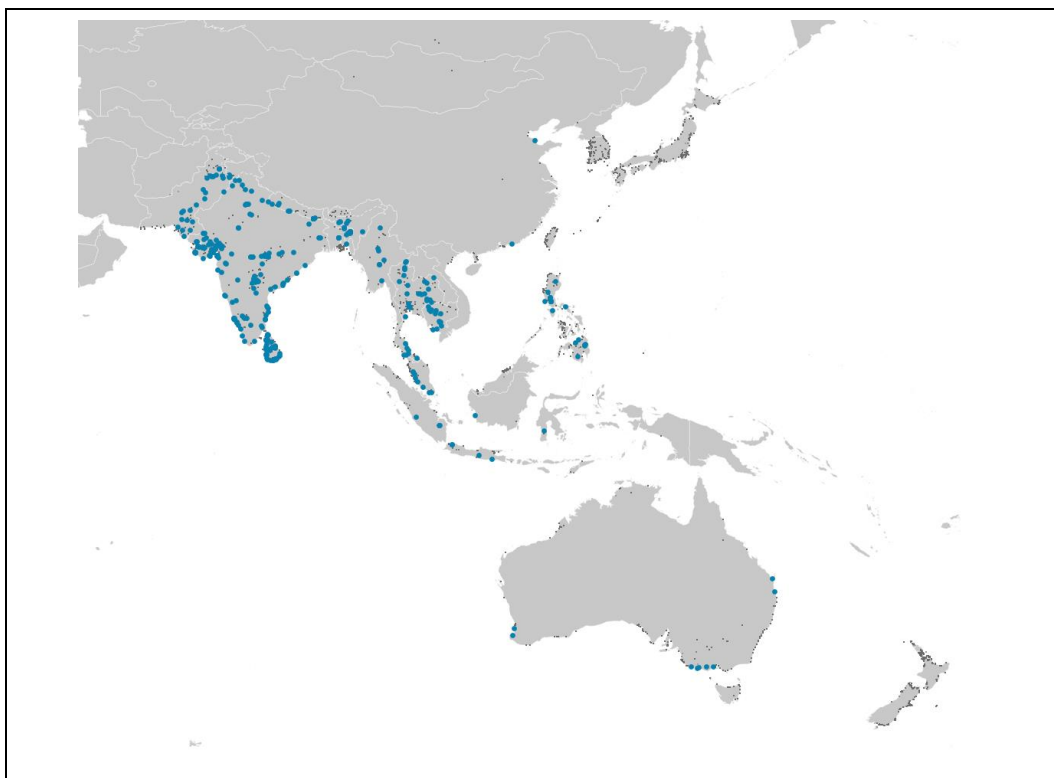

## Rails, Gallinules and Coot

Common Coot *Fulica atra* LC widespread in E, S and SE Asia, between 224,100-365,900 reported annually (WPE 1,600,000-2,500,000).

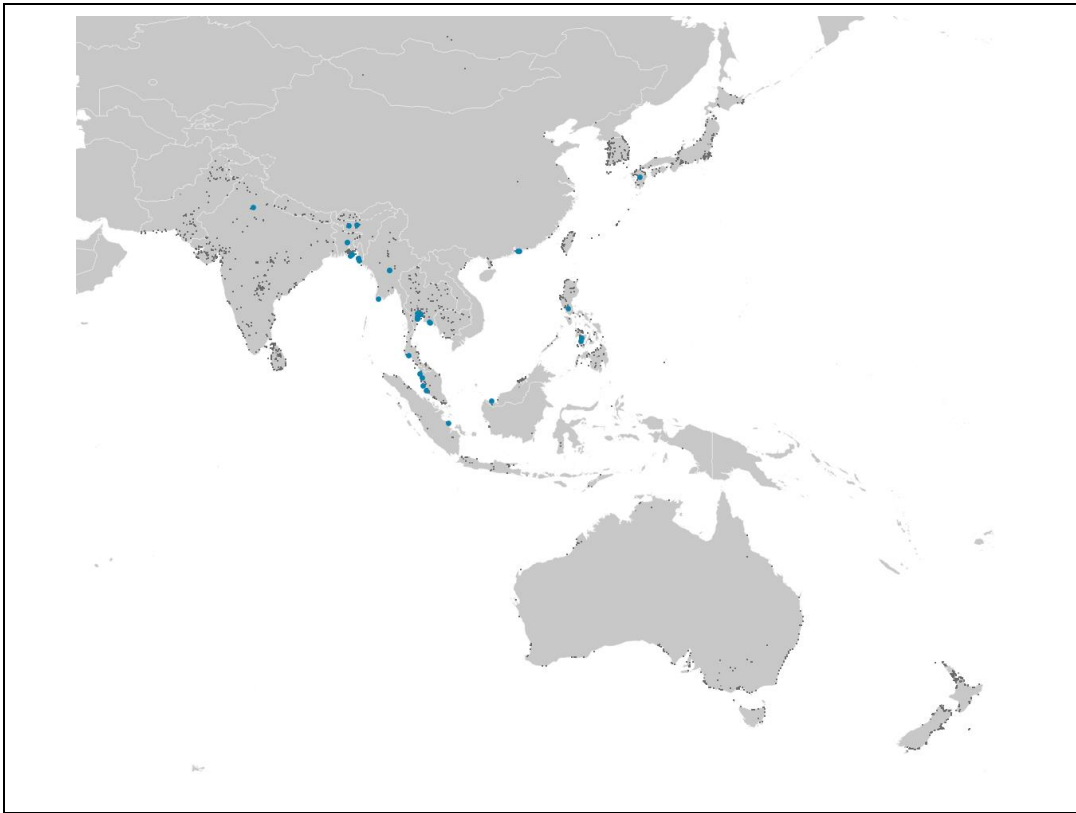

Purple Swamphen *Porphyrio porphyrio* LC in E, S and SE Asia and Australia, between 10,500-52,200 reported annually (WPE, no estimate).

## Shorebirds

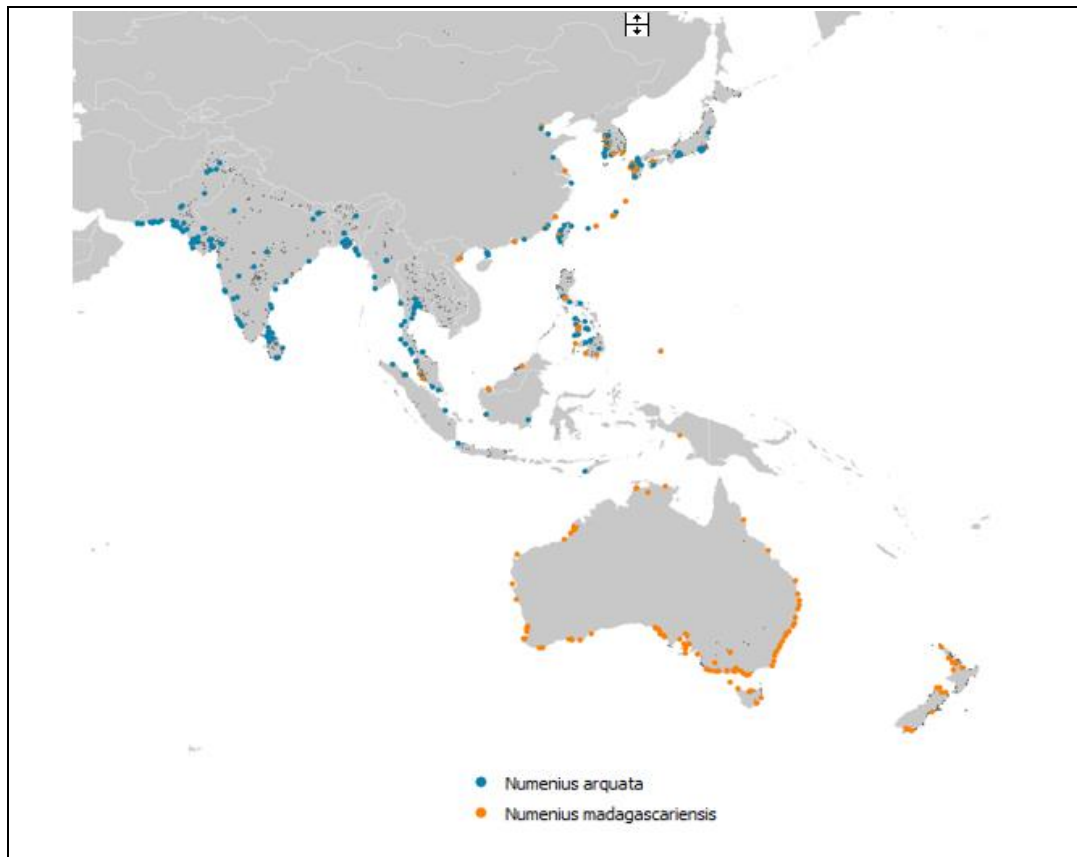

Spotted Greenshank *Tringa guttifer* EN in E, S and SE Asia, between 9-142 reported annually (WPE 400-600).

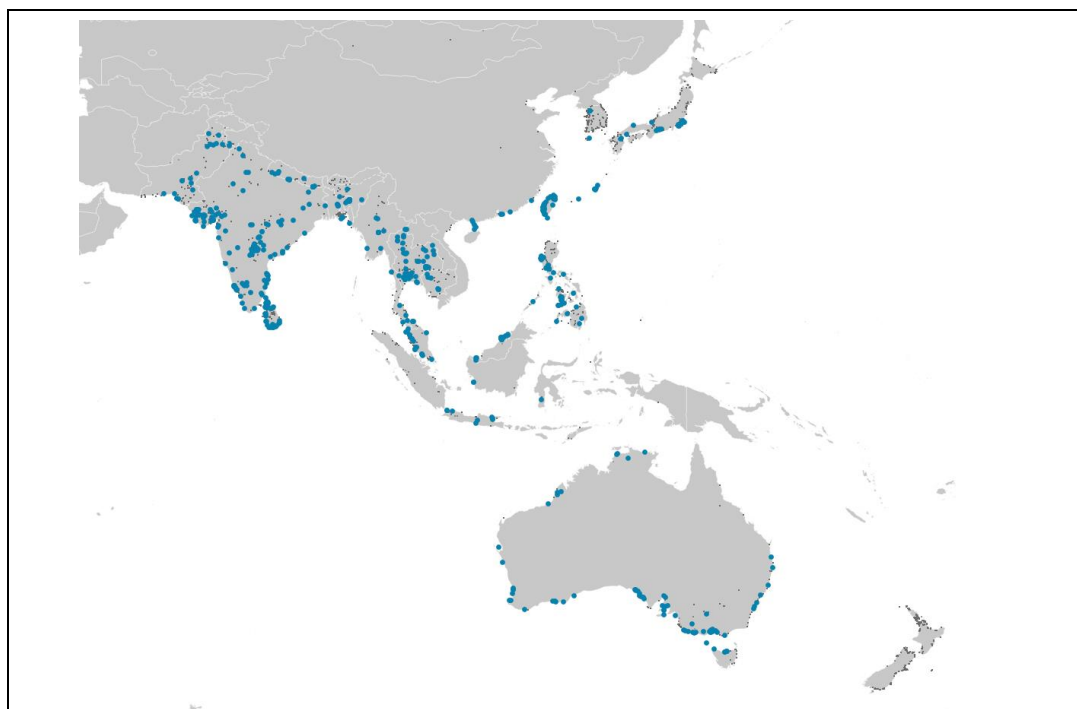

Whimbrel *Numenius phaeopus* LC in E, S and SE Asia and Australia, between 2,400-5,200 reported annually (WPE 80,000-155,000).

Eurasian Curlew *Numenius arquata* NT in E, S and SE Asia and Australasia, between 9,800-20,700 reported annually (WPE 110,000-200,000). Far Eastern Curlew *Numenius madagascariensis* EN in E, SE Asia and Australia, between 55-617 reported annually (WPE 32,000).

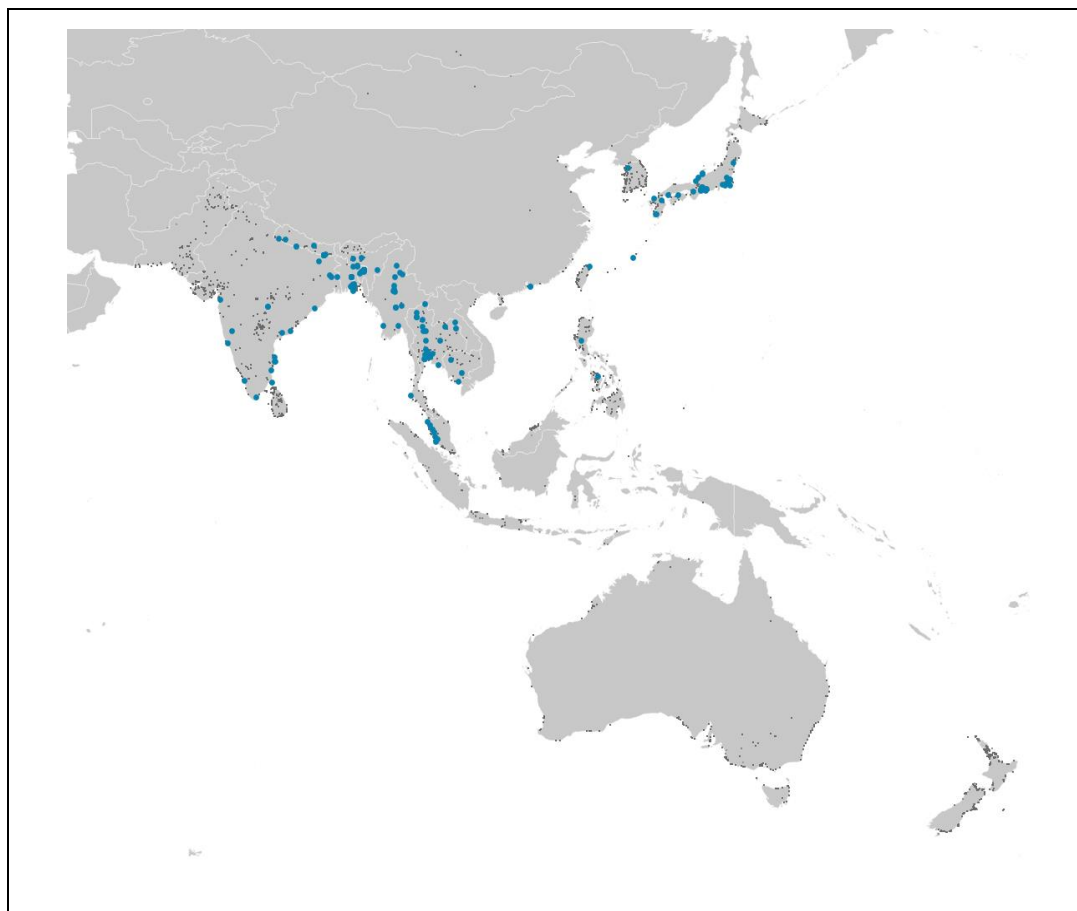

Wood Sandpiper *Tringa glareola* LC in E, S and SE Asia and Australia, between 3,300-18,200 reported annually (WPE 200,000-300,000).

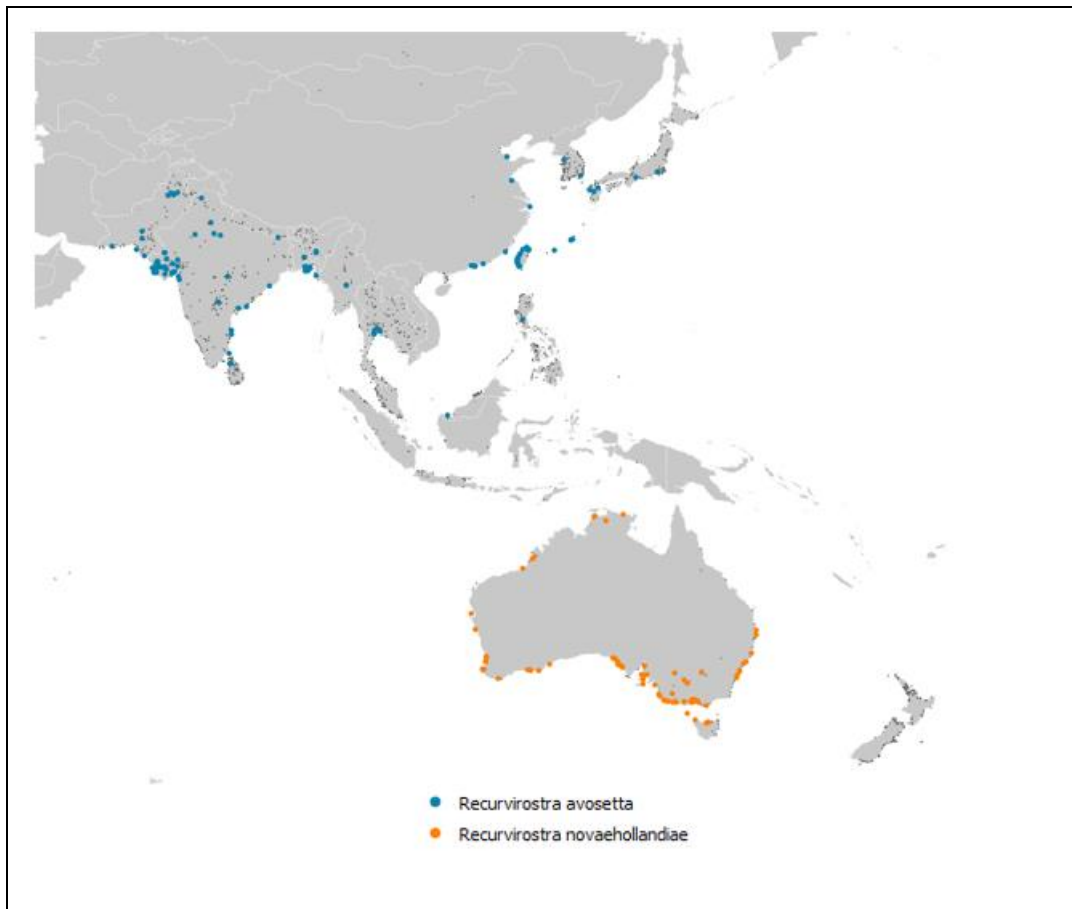

Grey-headed Lapwing *Vanellus cinereus* LC in E, S and SE Asia, between 800-3,300 reported annually (WPE 25,000 - 100,000).

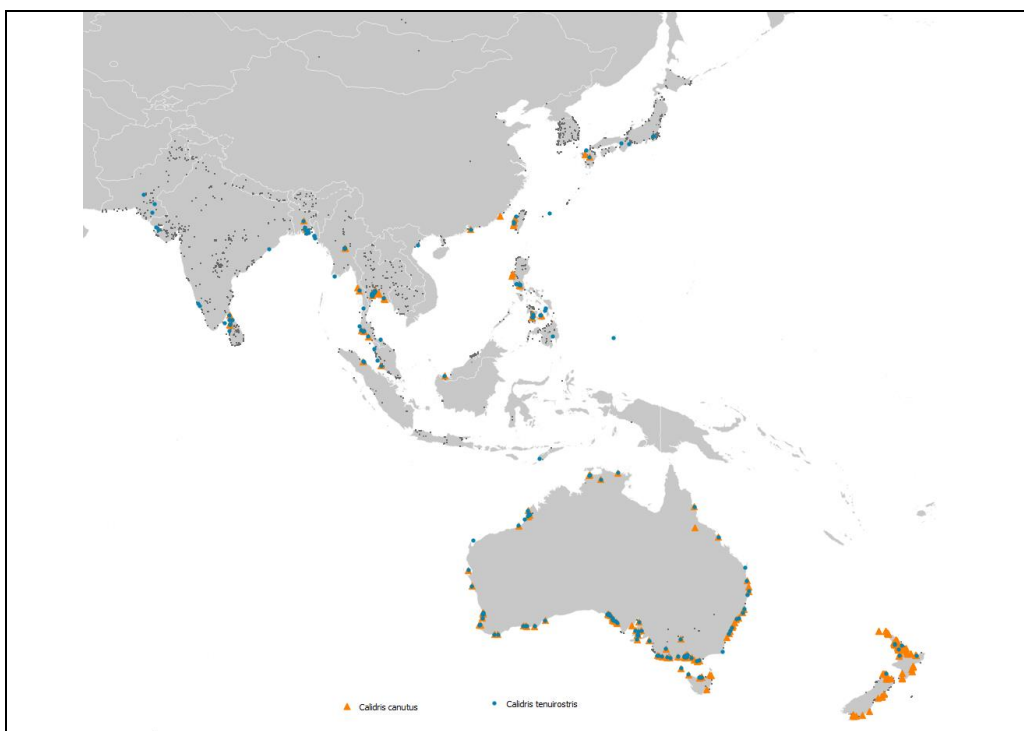

Pacific Golden Plover *Pluvialis fulva* LC in E, S and SE Asia and Australia, between 10,400-22,600 reported annually (WPE 150,000-200,000).

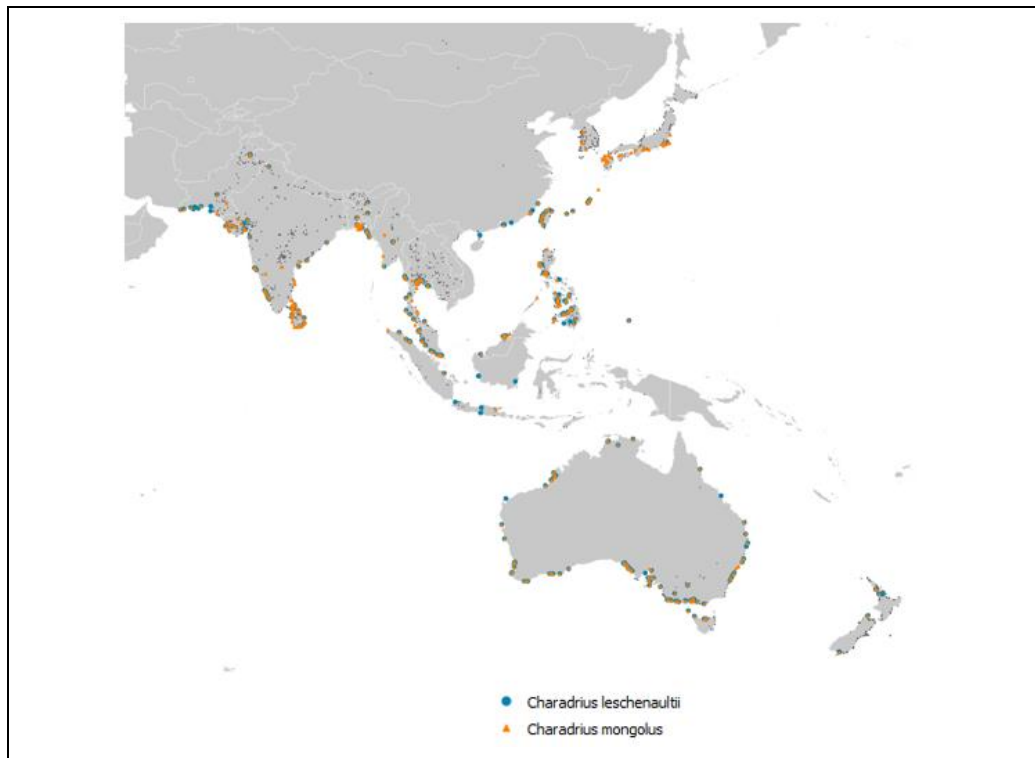

Pied Avocet *Recurvirostra avosetta* LC between in E, S and SE Asia, 14,900-38,400 reported annually (WPE 110,000-200,000). Red-necked Avocet *Recurvirostra novaehollandiae* LC in Australia, between 1,300-11,000 reported annually (WPE 107,000 - 107,000).

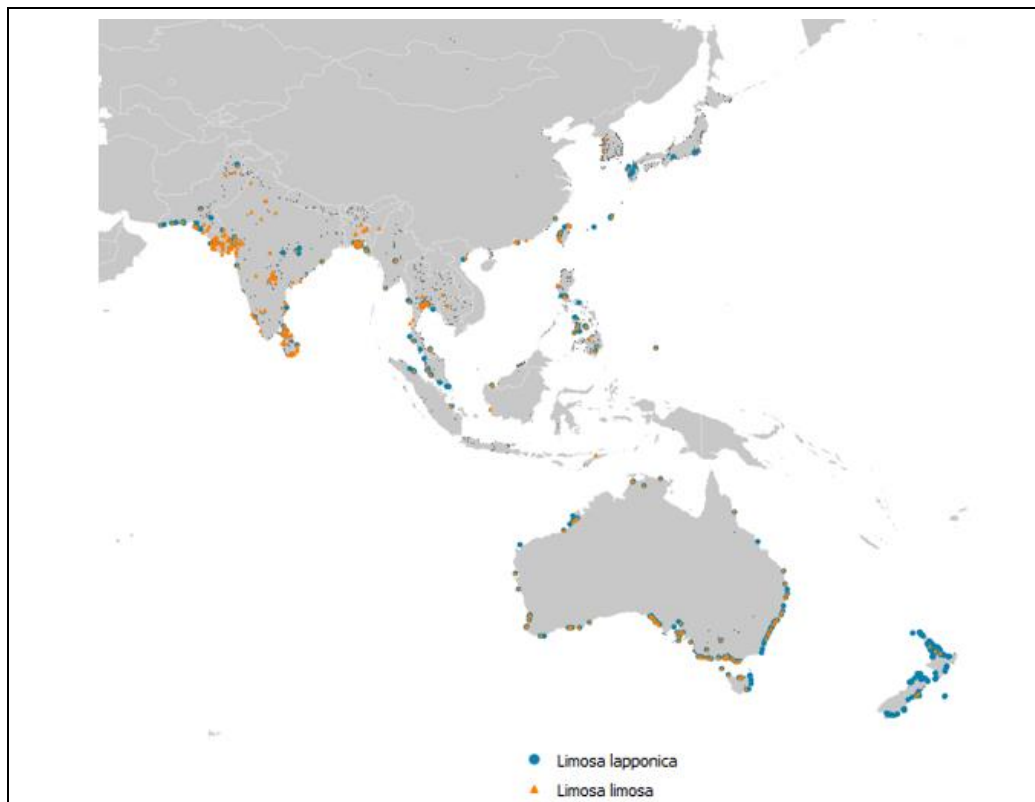

Great Knot *Calidris tenuirostris* EN between 17,495-175,166 reported annually (WPE 290,000-295,000). Red Knot *Calidris canutus* NT between 18,900-45,500 reported annually (WPE 116,000-139,000).

Lesser Sandplover *Charadrius mongolus* LC between 29,000-79,000 reported annually (WPE 188,500-218,500). Greater Sandplover *Charadrius leschenaultii* LC between 12,000-76,000 reported annually (WPE 104,000-179,000).

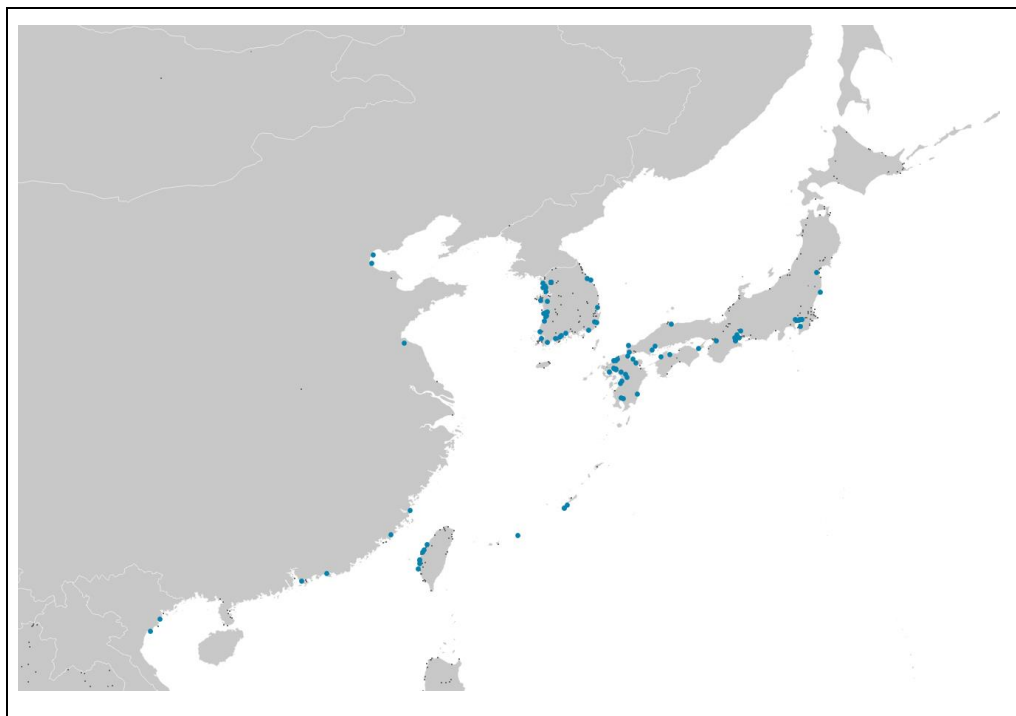

Two godwit species both NT occurring in E, S and SE Asia and Australasia, Bar-tailed Godwit *Limosa lapponica* between 81,000-112,000 reported annually (WPE 289,000) and Black-tailed Godwit *Limosa limosa* between 24,000 -139,000 reported annually (WPE 379,000-429,000).

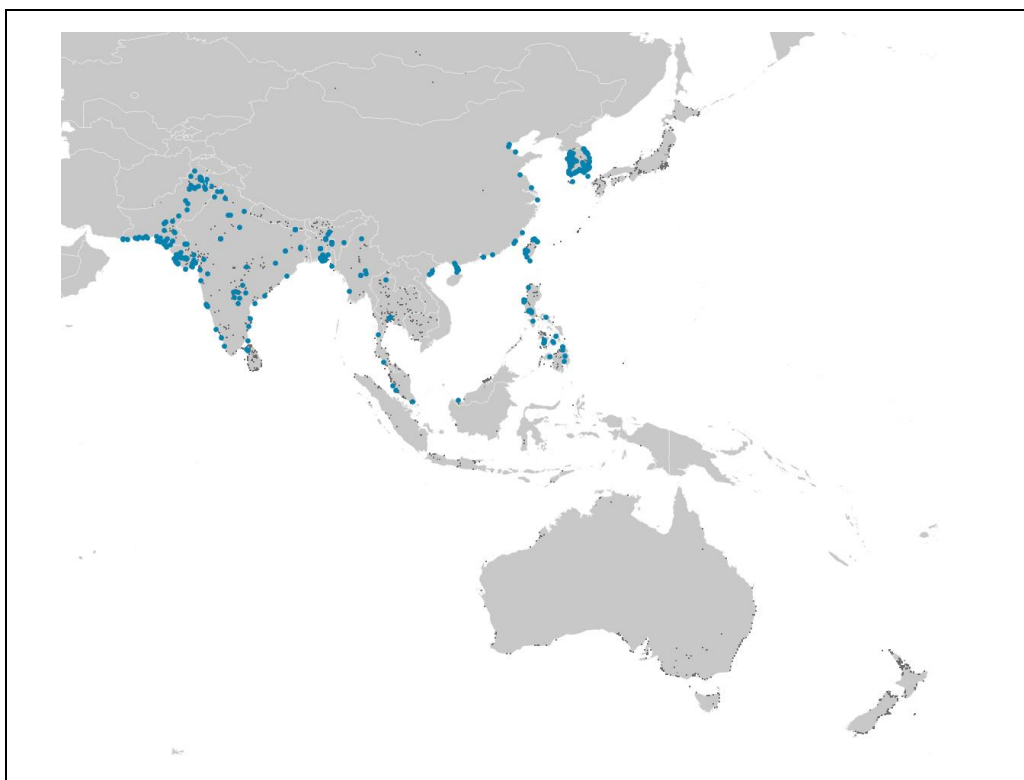

## Gulls, Terns and Skimmer

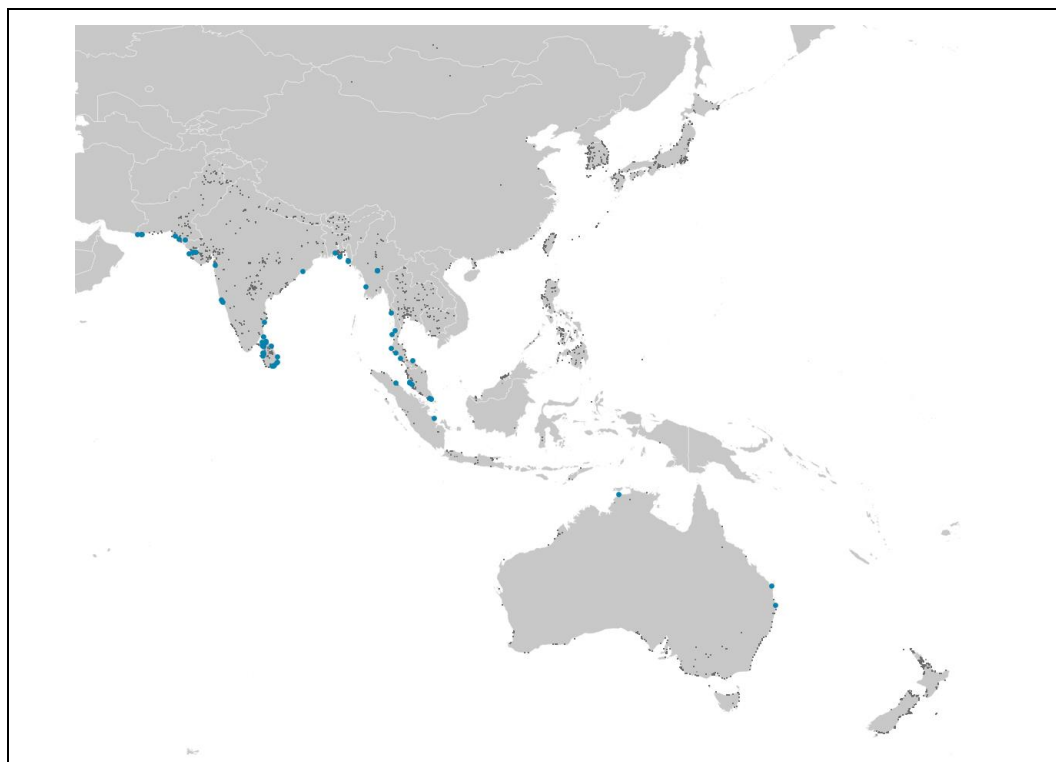

Saunders's Gull LC in E Asia, between 32-153 reported annually (WPE 7,100-9,600).

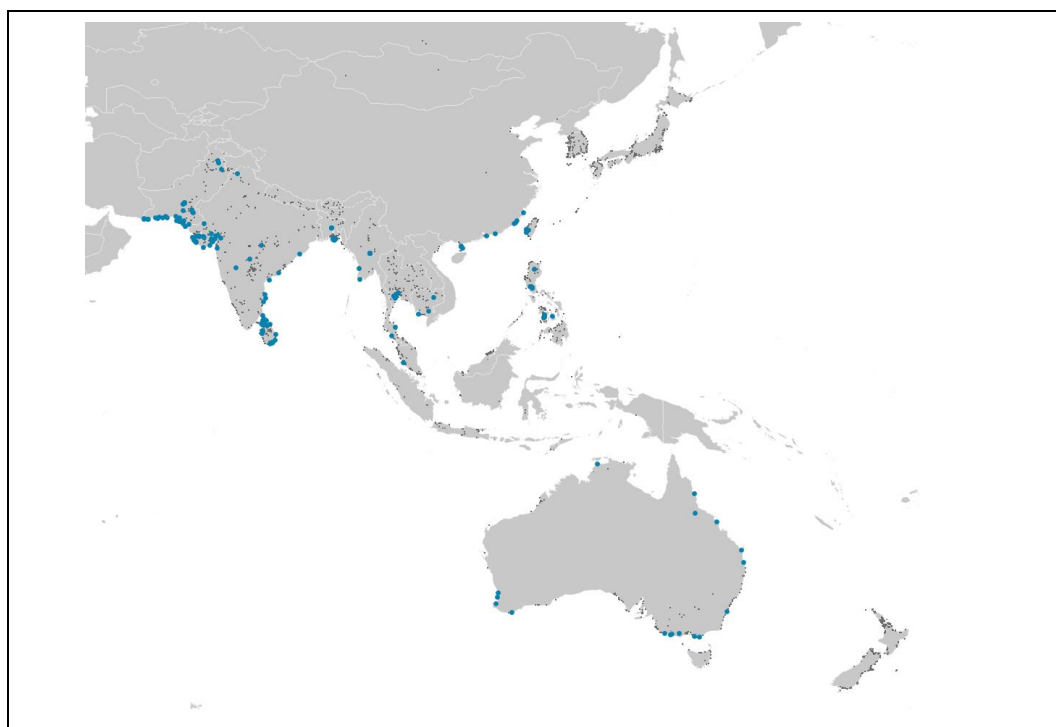

Black-headed Gull *Larus ridibundus* LC in E, S and SE Asia, between 35,400-85,800 reported annually (WPE 125,000-2,000,000).

Lesser Crested Tern *Thalasseus bengalensis* LC in S and SE Asia and Australia, between 1,000-121,600 reported annually (WPE 175,000-280,000).

Caspian Tern *Hydroprogne caspia* LC in E, S and SE Asia and Australia, between 300-13,900 reported annually (WPE 70,000-225,000).

## Synthesis and Next Steps

This regional summary report for 2008-2015 provides valuable overview of the current status of information being generated and shared at the flyway level (covering the Central Asian and East Asian – Australasian flyways) through the annual Asian Waterbird Census. However, as highlighted in the Fifth Edition of Waterbird Population Estimates - WPE5 (Wetlands International 2012), the proportion of species for which no population size estimate exists is highest in Asia and Oceania (also in the Neotropics). Furthermore, Asia has the highest proportion (50%) of known declining populations in the world. There is an urgent need for ongoing comprehensive assessment of the status and trends of species to provide a basis for prioritisation and effective conservation action for waterbirds and their habitats across the region.

At the species level, the report collates new information on species that are significantly different to those published in WPE5 in 2012 and re-emphasises the need for such population assessments as data increases and the size of the populations change. For example, between 680-89,100 Barheaded Goose were reported annually to the AWC between 2008-2015. This upper limit is considerably higher than the overall WPE5 estimate for the species of 52,000-60,000. Numbers summarised in this report do not take into consideration an additional 67,000 Bar-headed Geese counted in south-central Tibet during January 2014 (Dongping et al 2017). A similar situation of changes in population sizes exists for other Anatidae species in East Asia as demonstrated by Jia et al. (2016).

The value of AWC information for such analyses has already been demonstrated for many waterbird species and populations recently: Eurasian Coot in East Asia (Hashimoto et al 2013), shorebirds in the East Asian - Australasian Flyway (Hansen et al in prep) Bar-headed Goose (Dongping et al 2017), ducks and Black-faced Spoonbill in East Asia (Li et al. 2009).

The report also highlights the variation in the numbers of sites being reported annually. In many countries this reflects an increase of coverage, but is also a result of inconsistency in annual coverage of sites. For meaningful status assessments for most waterbird populations, the consistency in which sites are covered and reported needs to be improved. Although there has been an improvement in the local capacity and skills of the volunteer network in some countries, in others there is a need to enhance this through targeted training and skill development.

It is noted that a number of national and regional datasets are not currently incorporated into the AWC. It is possible that the importance of regular flyway scale status assessments and the need to pool data in order to generate them is not as widely understood as it should be among certain stakeholders in the region. More effort is needed working with AWC coordinators and others on an ongoing basis to secure this information to address geographic and species gaps.

This long-term information base provides is an important resource for Governments to report on achievements against agreed regional and global targets and priorities, including Aichi Targets on Biodiversity (including Targets #11 and #12) and Sustainable Development Goals (SDG) including goals #14, #15 and #17. Efforts are needed to ensure that up-to-date monitoring and conservation outcomes for waterbirds and wetlands are being included in national reporting by all governments to the Convention on Migratory Species COP12 in 2017, Ramsar Convention COP13 and Convention of Biological Diversity COP14 in 2018, and EAAFP MOP10 in 2019.

This will require working closely with the East Asian - Australasian Flyway Partnership, the Ramsar Convention, the Convention on Migratory Species, the Association of South East Asian Nations (ASEAN) and South Asia Cooperative Environment Programme (SACEP) and other regional frameworks to enhance the effectiveness and application of this information.

## Annex 2. Total numbers of waterbird species reported to the AWC 2008-2015

Scientific Name	Common Name	RL Status	2008	2009	2010	2011	2012	2013	2014	2015
<b>Anatidae</b>										
<i>Dendrocygna guttata</i>	Spotted Whistling-duck	LC					24			20
<i>Dendrocygna bicolor</i>	Fulvous Whistling-duck	LC	30,547	13,663	5,431	11,317	3,538	6,902	5,485	11,397
<i>Dendrocygna eytoni</i>	Plumed Whistling-duck	LC	12							
<i>Dendrocygna arcuata</i>	Wandering Whistling-duck	LC	4,503	4,232	6,043	747	6,277	5,347	4,788	3,759
<i>Dendrocygna javanica</i>	Lesser Whistling-duck	LC	169,030	107,640	44,552	101,364	197,452	139,821	148,157	128,744
<i>Oxyura australis</i>	Blue-billed Duck	NT	584							
<i>Oxyura leucocephala</i>	White-headed Duck	EN					1		8	
<i>Biziura lobata</i>	Musk Duck	LC	338							
<i>Malacorhynchus membranaceus</i>	Pink-eared Duck	LC	206							
<i>Cereopsis novaehollandiae</i>	Cape Barren Goose	LC	22							
<i>Cygnus atratus</i>	Black Swan	LC	18,118							
<i>Cygnus olor</i>	Mute Swan	LC	93	53	53	134	232	456	45	103
<i>Cygnus cygnus</i>	Whooper Swan	LC	18,160	23,235	18,836	21,900	16,259	16,894	18,511	18,180
<i>Cygnus columbianus columbianus</i>	Tundra Swan	LC (SS)	3	15	11	15	14	16	27	11
<i>Cygnus columbianus bewickii</i>	Bewick's Swan	LC (SS)	19,283	21,308	21,038	20,448	19,496	25,527	20,986	17,388
<i>Cygnus spp.</i>	Unidentified Swans	NR	81	173	2,453	1,073	3,491	716	1,486	1,825
<i>Branta bernicla</i>	Brent Goose	LC	3,617	2,312	1,087	1,863	1,910	1,644	1,531	1,476
<i>Branta hutchinsii</i>	Cackling Goose	LC		1					28	284
<i>Branta hutchinsii leucopareia</i>	Cackling Goose (leucopareia)	LC (SS)	1	55	51	66	282	190	697	1,021
<i>Anser caerulescens</i>	Snow Goose	LC	2	3	38	78	81	207	309	247
<i>Anser indicus</i>	Bar-headed Goose	LC	678	1,825	3,770	12,097	6,742	15,031	53,687	89,077
<i>Anser anser</i>	Greylag Goose	LC	14,432	2,782	2,982	4,242	16,887	9,129	4,220	29,031
<i>Anser cygnoid</i>	Swan Goose	VU	890	400	424	393	709	420	341	360
<i>Anser fabalis</i>	Bean Goose	LC	56,084	75,323	52,932	58,712	57,242	59,538	78,025	89,671

The Asian Waterbird Census 2008-2015 - results of coordinated counts in Asia and Australasia

Scientific Name	Common Name	RL Status	2008	2009	2010	2011	2012	2013	2014	2015
<i>Anser fabalis fabalis</i>	Taiga Bean Goose	LC (SS)				2		2		
<i>Anser fabalis middendorffii</i>	Taiga Bean Goose (middendorffii)	LC (SS)	11,387	10,077	7,651	9,132	13,834	12,483	17,331	15,462
<i>Anser fabalis serrirostris</i>	Tundra Bean Goose (serrirostris)	LC (SS)	2,844	1,860	1,316	537	2,450	3,386	686	640
<i>Anser albifrons</i>	Greater White-fronted Goose	LC	259,271	219,515	222,250	231,270	258,287	264,895	251,075	287,877
